Atazanavir: May increase the serum concentration of Irinotecan. The metabolism (via glucuronidation) of the active SN-38 metabolite may be primarily impacted by this interaction. *Risk X: Avoid combination*

Bevacizumab: May enhance the adverse/toxic effect of Irinotecan. *Risk C: Monitor therapy*

CYP2B6 Inducers (Strong): May increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Irinotecan. *Risk D: Consider therapy modification*

Sorafenib: May increase the serum concentration of Irinotecan. Sorafenib may also increase the concentration of the active metabolite of irinotecan, SN-38. *Risk C: Monitor therapy*

St Johns Wort: May diminish the therapeutic effect of Irinotecan. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (decreases the efficacy of irinotecan).

Monitoring ParametersCBC with differential, platelet count, and hemoglobin with each dose; bilirubin, electrolytes (with severe diarrhea); bowel movements and hydration status; monitor infusion site for signs of inflammation and avoid extravasation

Nursing: Physical Assessment/MonitoringUse caution and closely monitor use for patients with increased risk of neutropenia, previous pelvic or abdominal radiation, elderly patients with comorbid conditions. Assess potential for interactions with other pharmacological agents prescriptions or herbal products patient may be taking (eg, potential for increased or decreased levels/effects of irinotecan). Premedicate with antiemetic (emetic potential moderately high). Infusion site must be monitored to prevent extravasation. Assess results of laboratory tests (CBC with differential and platelet count), therapeutic effectiveness, and adverse response before each infusion and at regular intervals during therapy (eg, neutropenia, immediate or delayed diarrhea [can be fatal], sepsis, mucositis and/or stomatitis). Teach patient possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count, bilirubin, electrolytes (with severe diarrhea)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be administered by infusion. Report immediately any burning, pain, redness, or swelling at infusion site. Maintain adequate hydration (3-4 L/day of fluids) unless instructed to restrict fluid intake during therapy. May cause severe diarrhea; follow instructions for taking antidiarrheal medication (do not use antidiarrheal medication for longer than 48 consecutive hours). Report immediately if diarrhea persists or you experience signs of dehydration (eg, fainting, dizziness, lightheadedness). You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). You may experience nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); hair loss (will regrow after treatment is completed). Report immediately persistent diarrhea; unresolved nausea, or vomiting, alterations in urinary pattern (increased or decreased); opportunistic infection (fever, chills, unusual bruising or bleeding, fatigue, purulent vaginal discharge, unhealed mouth sores), chest pain or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant or cause a pregnancy (males) while taking this medication. Consult prescriber for use appropriate contraceptive measures (may cause severe fetal defects). Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 20 mg/mL (2 mL, 5 mL)

Camptosar®: 20 mg/mL (2 mL, 5 mL) [contains sorbitol 45 mg/mL]

Generic AvailableYes

Mechanism of ActionIrinotecan and its active metabolite (SN-38) bind reversibly to topoisomerase I-DNA complex preventing religation of the cleaved DNA strand. This results in the accumulation of cleavable complexes and double-strand DNA breaks. As mammalian cells cannot efficiently repair these breaks, cell death consistent with S-phase cell cycle specificity occurs, leading to termination of cellular replication.

Pharmacodynamics/Kinetics

Distribution: V_d: 33-150 L/m^2

Protein binding, plasma: Predominantly albumin; Parent drug: 30% to 68%, SN-38 (active metabolite): ~95%

Metabolism: Primarily hepatic to SN-38 (active metabolite) by carboxylesterase enzymes; SN-38 undergoes conjugation by UDP- glucuronosyl transferase 1A1 (UGT1A1) to form a glucuronide metabolite. Conversion of irinotecan to SN-38 is decreased and glucuronidation of SN-38 is increased patients who smoke cigarettes, resulting in lower levels of the metabolite and overall decreased systemic exposure. SN-38 is increased by UGT1A1*28 polymorphism (10% of North Americans are homozygous for UGT1A1*28 allele). The lactones of both irinotecan and SN-38 undergo hydrolysis to inactive hydroxy acid forms.

Half-life elimination: SN-38: Mean terminal: 10-20 hours

Time to peak: SN-38: Following 90-minute infusion: ~1 hour

Excretion: Within 24 hours: Urine: Irinotecan (11% to 20%), metabolites (SN-38 <1%, SN-38 glucuronide, 3%)

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsPatients who are homozygous for the UGT1A1*28 allele are at increased risk for neutropenia; a decreased dose is recommended. Clinical research of patients who are heterozygous for UGT1A1*28 have been variable for increased neutropenic risk and such patients have tolerated normal starting doses. An FDA-approved test (Invader® Molecular Assay) is available for clinical determination of UGT phenotype.

The recommended regimen to manage late diarrhea is loperamide 4 mg orally at onset of late diarrhea, followed by 2 mg every 2 hours (or 4 mg every 4 hours at night) until 12 hours have passed without a bowel movement. If diarrhea recurs, then repeat administration. Loperamide should not be used for more than 48 consecutive hours.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Increased salivation, mucositis, and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and insomnia are common

Mental Health: Effects on Psychiatric TreatmentMay cause myelosuppression; use caution with clozapine and carbamazepine; concurrent use with prochlorperazine has produced akathisia. Two severe (life-threatening) forms of diarrhea may occur; these effects may be additive with concurrent use of SSRIs, lithium, or valproate; use caution.

Index TermsCamptothecin-11; CPT-11; NSC-616348

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Dexferrum® may be confused with Desferal®

Pronunciation(EYE ern DEKS tran KOM pleks)

U.S. Brand NamesDexferrum®; INFeD®

Canadian Brand NamesDexiron™; Infufer®

Pharmacologic CategoryIron Salt

Use: Labeled IndicationsTreatment of iron deficiency in patients in whom oral administration is infeasible or ineffective

Dosing: Adults

Note: A 0.5 mL test dose should be given prior to starting iron dextran therapy.

Iron-deficiency anemia: I.M. (INFeD®), I.V. (Dexferrum®, INFeD®):

Dose (mL) = 0.0442 (desired Hgb - observed Hgb) x LBW + (0.26 x LBW)

Desired hemoglobin: Usually 14.8 g/dL

LBW = Lean body weight in kg

Iron replacement therapy for blood loss: (INFeD®), I.V. (Dexferrum®, INFeD®): Replacement iron (mg) = blood loss (mL) x Hct

Cancer-associated anemia (NCCN guidelines v.3.2009): I.V.: Test dose: 25 mg slow I.V. slow push, followed 1 hour later by 100 mg over 5 minutes; larger doses (unlabeled), up to total dose infusion (over several hours) may be administered

Maximum daily dosage: Manufacturer's labeling: **Note:** Replacement of larger estimated iron deficits may be achieved by serial administration of smaller incremental dosages. Daily dosages should be limited to 100 mg iron (2 mL)

Total dose infusion (unlabeled): The entire dose (estimated iron deficit) may be diluted and administered as a one-time I.V. infusion.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** A 0.5 mL test dose (0.25 mL in infants) should be given prior to starting iron dextran therapy.

Iron-deficiency anemia: I.M. (INFeD®), I.V. (Dexferrum®, INFeD®):

Children 5-15 kg: Should not normally be given in the first 4 months of life:

Dose (mL) = 0.0442 (desired Hgb - observed Hgb) x W + (0.26 x W)

Desired hemoglobin: Usually 12 g/dL

W = Total body weight in kg

Children >15 kg: Refer to adult dosing.

Iron replacement therapy for blood loss: Refer to adult dosing.

Maximum daily dose:

Children <5 kg: 25 mg iron (0.5 mL)

Children 5-10 kg: 50 mg iron (1 mL)

Children ≥10 kg: Refer to adult dosing.

Calculations

- Iron Dextran

Administration: I.M.**Note:** Test dose: A test dose should be given on the first day of therapy; patient should be observed for 1 hour for hypersensitivity reaction, then the remaining dose (dose minus test dose) should be given. Epinephrine should be available.

I.M. (INFeD®): Use Z-track technique (displacement of the skin laterally prior to injection); injection should be deep into the upper outer quadrant of buttock; alternate buttocks with subsequent injections. Administer test dose at same recommended site using the same technique.

Administration: I.V.Test dose should be given gradually over at least 30 seconds (INFeD®) or 5 minutes (Dexferrum®). Subsequent dose(s) may be administered by I.V. bolus undiluted at a rate not to exceed 50 mg/minute or diluted in 250-1000 mL NS and infused over 1-6 hours (initial 25 mL should be given slowly and patient should be observed for allergic reactions); avoid dilutions with dextrose (increased incidence of local pain and phlebitis)

Administration: I.V. DetailpH: 4.2-7

StorageStore at controlled room temperature.

ReconstitutionSolutions for infusion should be diluted in 250-1000 mL NS.

CompatibilityStable in D_5W, NS; **variable stability (consult detailed reference)** in TPN.

Compatibility when admixed: Compatible: Cyanocobalamin, netilmicin.

ContraindicationsHypersensitivity to iron dextran or any component of the formulation; any anemia not associated with iron deficiency

Allergy Considerations

- Iron Salt Allergy

Warnings/Precautions

Boxed warnings:

- Anaphylactic-type reactions: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactic-type reactions: **[U.S. Boxed Warning]: Deaths associated with parenteral administration following anaphylactic-type reactions have been reported (use only where resuscitative equipment and personnel are available).** Adverse events (including life-threatening) associated with iron dextran usually occur more with the high-molecular-weight formulation (DexFerrum®), compared to low-molecular-weight (INFeD®) (Chertow, 2006).

- Delayed reaction: Delayed (1-2 days) infusion reaction (including arthralgia, back pain, chills, dizziness, and fever) may occur with large doses (eg, total dose infusion) of I.V. iron dextran; usually subsides within 3-4 days. May also occur (less commonly) with I.M. administration; subsiding within 3-7 days.

Disease-related concerns:

- Allergies/asthma: Use with caution in patients with a significant history of allergies or asthma.

- Cancer-associated anemia: In patients with cancer-related anemia (either due to cancer or chemotherapy-induced) requiring iron supplementation, the I.V. route is superior to oral therapy; I.M. administration is not recommended for parenteral iron supplementation.

- Cardiovascular disease: Use with caution in patients with pre-existing cardiovascular disease; iron dextran may exacerbate cardiovascular complications.

- Hepatic impairment: Use with extreme caution in patients with serious hepatic impairment.

- Renal disease/impairment: In patients with chronic kidney disease (CKD) requiring iron supplementation, the I.V. route is preferred for hemodialysis patients; either oral iron or I.V. iron may be used for nondialysis and peritoneal dialysis CKD patients. Avoid use during acute kidney infection.

- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may exacerbate joint pain and swelling.

Special populations:

- Elderly: Anemia in the elderly is often caused by “anemia of chronic disease” or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. I.V. administration of iron dextran is often preferred over I.M. in the elderly secondary to a decreased muscle mass and the need for daily injections.

- Pediatrics: Not recommended in children <4 months of age. Intramuscular iron dextran use in neonates may be associated with an increased incidence of gram-negative sepsis.

Other warnings/precautions:

- Appropriate use: Use only in patients where the iron deficient state is not amenable to oral iron therapy. Discontinue oral iron prior to initiating parenteral iron therapy.

- Carcinogenicity: Intramuscular injections of iron-carbohydrate complexes may have a risk of delayed injection site tumor development.

- Iron overload: Exogenous hemosiderosis may result from excess iron stores; patients with refractory anemias and/or hemoglobinopathies may be prone to iron overload with unwarranted iron supplementation.

- Test dose: A test dose of 0.5 mL I.V. or I.M. should be given to observe for adverse reactions.

Geriatric ConsiderationsAnemia in the elderly is most often caused by “anemia of chronic disease”, a result of aging effect in bone marrow, or associated with inflammation rather than blood loss. Iron stores are usually normal or increased, with a serum ferritin >50 ng/mL and a decreased total iron binding capacity. Hence, the anemia is not secondary to iron deficiency but the inability of the reticuloendothelial system to use available iron stores. I.V. administration of iron dextran is often preferred over I.M. in the elderly secondary to a decreased muscle mass and the need for daily injections.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in animal reproduction studies. It is not known if iron dextran (as iron dextran) crosses the placenta. It is recommended that pregnant women meet the dietary requirements of iron with diet and/or supplements in order to prevent adverse events associated with iron deficiency anemia in pregnancy. Treatment of iron deficiency anemia in pregnant women is the same as in nonpregnant women and in most cases, oral iron preparations may be used. Except in severe cases of maternal anemia, the fetus achieves normal iron stores regardless of maternal concentrations.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsTrace amounts of iron dextran (as iron dextran) are found in human milk. Iron is normally found in breast milk. Breast milk or iron fortified formulas generally provide enough iron to meet the recommended dietary requirements of infants. The amount of iron in breast milk is generally not influenced by maternal iron status.

Adverse ReactionsFrequency not defined. **Note:** Adverse event risk is reported to be higher with the high-molecular-weight iron dextran formulation.

Cardiovascular: Arrhythmia, bradycardia, cardiac arrest, chest pain, chest tightness, cyanosis, flushing, hyper-/hypotension, shock, syncope, tachycardia

Central nervous system: Chills, disorientation, dizziness, fever, headache, malaise, seizure, unconsciousness, unresponsiveness

Dermatologic: Pruritus, purpura, rash, urticaria

Gastrointestinal: Abdominal pain, diarrhea, nausea, taste alteration, vomiting

Genitourinary: Discoloration of urine

Hematologic: Leukocytosis, lymphadenopathy

Local: Injection site reactions (cellulitis, inflammation, pain, phlebitis, soreness, swelling), muscle atrophy/fibrosis (with I.M. injection), skin/tissue staining (at the site of I.M. injection), sterile abscess

Neuromuscular & skeletal: Arthralgia, arthritis/arthritis exacerbation, back pain, myalgia, paresthesia, weakness

Respiratory: Bronchospasm, dyspnea, respiratory arrest, wheezing

Renal: Hematuria

Miscellaneous: Anaphylactic reactions (sudden respiratory difficulty, cardiovascular collapse), diaphoresis

Postmarketing and/or case reports: Angioedema, tumor formation (at former injection site)

Drug Interactions

Cefdinir: Iron Salts may decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Dimercaprol: May enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

Eltrombopag: Iron Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., iron-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Phosphate Supplements: Iron Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Test InteractionsMay cause falsely elevated values of serum bilirubin and falsely decreased values of serum calcium. Residual iron dextran may remain in reticuloendothelial cells; may affect accuracy of examination of bone marrow iron stores. Bone scans with 99m Tc-labeled bone seeking agents may show reduced bony uptake, marked renal activity, and excess blood pooling and soft tissue accumulation following I.V. iron dextran infusion or with high serum ferritin levels. Following I.M. iron dextran, bone scans with 99m Tc-diphosphonate may show dense activity in the buttocks.

Monitoring ParametersHemoglobin, hematocrit, reticulocyte count, serum ferritin, serum iron, TIBC; monitor for anaphylaxis/hypersensitivity reaction

Reference Range

Hemoglobin: Adults:

Males: 13.5-16.5 g/dL

Females: 12.0-15.0 g/dL

Serum iron: 40-160 mcg/dL

Total iron binding capacity: 230-430 mcg/dL

Transferrin: 204-360 mg/dL

Percent transferrin saturation: 20% to 50%

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests regularly and patient for adverse reactions. Note that adverse response may occur some time (1-4 days) after administration. Assess patients with rheumatoid arthritis for exacerbated swelling and joint pain; adjust medications as needed.

Monitoring: Lab TestsHemoglobin, hematocrit, reticulocyte count, serum ferritin

Patient EducationYou will need frequent blood tests while on this therapy. If you have rheumatoid arthritis, you may experience increased swelling or joint pain; consult prescriber for medication adjustment. If you experience dizziness or severe headache, use caution when driving or engaging in tasks that require alertness until response to drug is known. Small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may relieve nausea and metallic taste. You may experience increased sweating. Report acute GI problems, fever, respiratory difficulty, rapid heartbeat, yellowing of skin or eyes, or swelling of hands and feet. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strength expressed as elemental iron

Injection, solution:

Dexferrum®: 50 mg/mL (1 mL, 2 mL) [high-molecular-weight iron dextran]

INFeD®: 50 mg/mL (2 mL) [low-molecular-weight iron dextran]

Generic AvailableNo

Mechanism of ActionThe released iron, from the plasma, eventually replenishes the depleted iron stores in the bone marrow where it is incorporated into hemoglobin

Pharmacodynamics/Kinetics

Onset of action: I.V.: Serum ferritin peak: 7-9 days after dose

Absorption:

I.M.: 50% to 90% is promptly absorbed, balance is slowly absorbed over month

I.V.: Uptake of iron by the reticuloendothelial system appears to be constant at about 10-20 mg/hour

Excretion: Urine and feces via reticuloendothelial system

Pharmacologic CategoryIron Salt

Use: Labeled IndicationsTreatment of iron-deficiency anemia in chronic renal failure, including nondialysis-dependent patients (with or without erythropoietin therapy) and dialysis-dependent patients receiving erythropoietin therapy

Dosing: AdultsDoses expressed in mg of **elemental** iron. **Note:** Test dose: Product labeling does not indicate need for a test dose in product-naive patients.

Iron-deficiency anemia in chronic renal disease: I.V.:

Hemodialysis-dependent patient: 100 mg over 2-5 minutes administered 1-3 times/week during dialysis; administer no more than 3 times/week to a cumulative total dose of 1000 mg (10 doses); may continue to administer at lowest dose necessary to maintain target hemoglobin, hematocrit, and iron storage parameters

Peritoneal dialysis-dependent patient: Slow intravenous infusion at the following schedule: Two infusions of 300 mg each over $1^{1}/_{2}$ hours 14 days apart followed by a single 400 mg infusion over $2^{1}/_{2}$ hours 14 days later (total cumulative dose of 1000 mg in 3 divided doses)

Nondialysis-dependent patient: 200 mg slow injection (over 2-5 minutes) on 5 different occasions within a 14-day period. Total cumulative dose: 1000 mg in 14-day period. **Note:** Dosage has also been administered as two infusions of 500 mg in a maximum of 250 mL 0.9% NaCl infused over 3.5-4 hours on day 1 and day 14 (limited experience)

Dosing: ElderlyInsufficient data to identify differences between elderly and other adults; use caution.

Dosing: PediatricDoses expressed in mg of **elemental** iron. **Note:** Test dose: Product labeling does not indicate need for a test dose in product-naive patients.

Iron-deficiency anemia in chronic renal disease (hemodialysis-dependent patients): Children ≥2 years (unlabeled use): I.V.:

Correction: 1 mg/kg/dose per dialysis session (maximum: 100 mg)

Maintenance therapy: 0.3 mg/kg/dose per dialysis session (maximum: 100 mg). **Note:** Dosing based on limited data from a study (Leijn, 2004); study used only 14 patients (2-14 years of age) with ESRD on hemodialysis. Study initially used an iron repletion dose of 3 mg/kg/dose per dialysis session which resulted in possible iron overload (ferritin >400 mcg/L); protocol dose subsequently lowered to 1 mg/kg/dose per dialysis session which resulted in a gradual increase in ferritin levels >100 mcg/L; maintenance therapy resulted in median ferritin levels between 193-250 mcg/L.

Administration: I.V.Not for rapid I.V. injection; inject slowly over 2-5 minutes. Can be administered through dialysis line. Do not mix with other medications or parenteral nutrient solutions.

Slow I.V. injection: May administer undiluted by slow I.V. injection (100 mg over 2-5 minutes in hemodialysis-dependent patients **or** 200 mg over 2-5 minutes in nondialysis-dependent patients)

Infusion: Dilute 100 mg in maximum of 100 mL 0.9% NaCl; infuse over at least 15 minutes; 300 mg/250 mL should be infused over at least $1^{1}/_{2}$ hours; 400 mg/250 mL should be infused over at least $2^{1}/_{2}$ hours; 500 mg/250 mL should be infused over at least $3^{1}/_{2}$ hours.

StorageStore vials at controlled room temperature of 25°C (77°F); do not freeze. Following dilution, solutions are stable for 48 hours at room temperature or under refrigeration.

ReconstitutionMay be administered via the dialysis line as an undiluted solution or by diluting 100 mg (5 mL) in a maximum of 100 mL normal saline. Doses ≥200 mg should be diluted in a maximum of 250 mL normal saline.

CompatibilityDo not mix with other medications.

ContraindicationsHypersensitivity to iron sucrose or any component of the formulation; evidence of iron overload; anemia not caused by iron deficiency

Allergy Considerations

- Iron Salt Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Cases of hypersensitivity reactions, including rare postmarketing anaphylactic and anaphylactoid reactions, have been reported.
- Hypotension: Has been reported frequently in hemodialysis-dependent patients. Has also been reported in peritoneal dialysis and nondialysis patients. Hypotension may be related to total dose or rate of administration (avoid rapid I.V. injection), follow

recommended guidelines.

Special populations:

- Pediatrics: Not FDA-approved for use in children.

Other warnings/precautions:

- Appropriate use: Withhold iron in the presence of tissue iron overload; periodic monitoring of hemoglobin, hematocrit, serum ferritin, and transferrin saturation is recommended.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Based on limited data, iron sucrose may be effective for the treatment of iron-deficiency anemia in pregnancy. It is recommended that pregnant women meet the dietary requirements of iron with diet and/or supplements in order to prevent adverse events associated with iron deficiency anemia in pregnancy. Treatment of iron deficiency anemia in pregnant women is the same as in nonpregnant women and in most cases, oral iron preparations may be used. Except in severe cases of maternal anemia, the fetus achieves normal iron stores regardless of maternal concentrations.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIron is normally found in breast milk. Breast milk or iron fortified formulas generally provide enough iron to meet the recommended dietary requirements of infants. The amount of iron in breast milk is generally not influenced by maternal iron status.

Adverse Reactions

>10%:

Cardiovascular: Hypotension (1% to 7%; 39% in hemodialysis patients; may be related to total dose or rate of administration), peripheral edema (2% to 13%)

Central nervous system: Headache (3% to 13%)

Gastrointestinal: Nausea (1% to 15%)

Neuromuscular & skeletal: Muscle cramps (1% to 3%; 29% in hemodialysis patients)

1% to 10%:

Cardiovascular: Hypertension (6% to 8%), edema (1% to 7%), chest pain (1% to 6%), murmur (<1% to 3%), heart failure

Central nervous system: Dizziness (1% to 10%), fatigue (2% to 5%), fever (1% to 3%)

Dermatologic: Pruritus (1% to 7%), rash (≤1%)

Endocrine & metabolic: Gout (2% to 7%), hypoglycemia (<1% to 4%), hyperglycemia (3% to 4%), fluid overload (1% to 3%)

Gastrointestinal: Diarrhea (1% to 10%), vomiting (3% to 9%), taste perversion (1% to 9%), peritoneal infection (≤8%), constipation (1% to 7%), abdominal pain (1% to 4%), positive fecal occult blood (1% to 3%)

Genitourinary: Urinary tract infection (≤1%)

Local: Injection site reaction (2% to 4%), catheter site infection (≤4%)

Neuromuscular & skeletal: Muscle pain (1% to 7%), extremity pain (3% to 6%), arthralgia (1% to 4%), weakness (1% to 3%), back pain (1% to 3%)

Ocular: Conjunctivitis (<1% to 3%)

Otic: Ear pain (1% to 7%)

Respiratory: Dyspnea (1% to 10%), pharyngitis (<1% to 7%), cough (1% to 7%), sinusitis (1% to 4%), nasopharyngitis (≤3%), upper respiratory infection (1% to 3%), nasal congestion (1%), rhinitis (≤1%)

Miscellaneous: Graft complication (1% to 10%), sepsis

<1%, postmarketing, and/or case reports: Anaphylactoid reactions, anaphylactic shock, bronchospasm (with dyspnea), collapse, facial rash, hypersensitivity (including wheezing), hypoesthesia, loss of consciousness, necrotizing enterocolitis (reported in premature infants, no causal relationship established), seizure, urticaria

Drug Interactions

Cefdinir: Iron Salts may decrease the serum concentration of Cefdinir. Red-appearing, non-bloody stools may also develop due to the formation of an insoluble iron-cefdinir complex. Management: Avoid concurrent cefdinir and iron when possible. Separating doses by several hours may minimize interaction. Iron-containing infant formulas do not appear to interact with cefdinir. *Risk D: Consider therapy modification*

Dimercaprol: May enhance the nephrotoxic effect of Iron Salts. *Risk X: Avoid combination*

Eltrombopag: Iron Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., iron-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Phosphate Supplements: Iron Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Iron Salts. Iron Salts may decrease the serum concentration of Trientine. *Risk D: Consider*

therapy modification

Monitoring ParametersHematocrit, hemoglobin, serum ferritin, transferrin, percent transferrin saturation, TIBC; takes about 4 weeks of treatment to see increased serum iron and ferritin, and decreased TIBC. Serum iron concentrations should be drawn 48 hours after last dose.
Reference Range

Hemoglobin: Adults:

Males: 13.5-16.5 g/dL

Females: 12.0-15.0 g/dL

Serum iron: 40-160 mcg/dL

Total iron binding capacity: 230-430 mcg/dL

Transferrin: 204-360 mg/dL

Percent transferrin saturation: 20% to 50%

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Facilities for cardiopulmonary resuscitation must be available during administration. Monitor blood pressure closely during infusion. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use according to product and purpose (dangers of iron overdosing), interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsHematocrit, hemoglobin, serum ferritin, transferrin, percent transferrin saturation, TIBC; takes about 4 weeks of treatment to see increased serum iron and ferritin, and decreased TIBC. Serum iron concentrations should be drawn 48 hours after last dose.
Patient EducationYou will be watched closely during infusion. You will need frequent blood tests while on this therapy. You may experience hypotension (use caution when driving or climbing stairs or engaging in tasks requiring alertness until response to drug is known); black tarry stools (normal), nausea, vomiting (taking with meals will reduce this), constipation (adequate fluids and exercise may help, may need a stool softener); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report immediately severe unresolved GI irritation (cramping, nausea, vomiting, diarrhea, constipation); headache, lethargy, fatigue, dizziness, or other CNS changes; rapid respiration; leg cramps; chest pain or palpations; swelling of extremities or unexplained weight gain; vision changes; choking sensation; loss of consciousness; or convulsions. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Venofer®: 20 mg of elemental iron/mL (5 mL, 10 mL)

Generic AvailableNo
Mechanism of ActionIron sucrose is dissociated by the reticuloendothelial system into iron and sucrose. The released iron increases serum iron concentrations and is incorporated into hemoglobin.
Pharmacodynamics/Kinetics

Distribution: V_{dss}: Healthy adults: 7.9 L

Metabolism: Dissociated into iron and sucrose by the reticuloendothelial system

Half-life elimination: Healthy adults: 6 hours

Excretion: Healthy adults: Urine (5%) within 24 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness and malaise
Mental Health: Effects on Psychiatric TreatmentHypotension is common; concurrent use with psychotropic medications may produce additive hypotensive effects; use caution. Nausea and vomiting are common; concurrent use with SSRIs, valproic acid, and lithium may produce additive effects; monitor.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(eye soe kar BOKS a zid)

U.S. Brand NamesMarplan®

Pharmacologic CategoryAntidepressant, Monoamine Oxidase Inhibitor

Use: Labeled IndicationsTreatment of depression

Dosing: AdultsDepression: Oral: Initial: 10 mg 2-4 times/day; may increase by 10 mg/day every 2-4 days to 40 mg/day by the end of the first week (divided into 2-4 doses). After first week, may increase by up to 20 mg/week to a maximum of 60 mg/day. May take 3-6 weeks to see effects. Dose should be reduced once maximum clinical effect is seen. If no response obtained within 6 weeks, additional titration is unlikely to be beneficial. **Note:** Use caution in patients on >40 mg/day; experience is limited.

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsAvoid tyramine-containing foods/beverages. Some examples include aged or matured cheese, air-dried or cured meats (including sausages and salamis), fava or broad bean pods, tap/draft beers, Marmite concentrate, sauerkraut, soy sauce and other soybean condiments.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

Contraindications

Hypersensitivity to isocarboxazid or any component of the formulation; cardiovascular disease (including CHF, or HTN); cerebrovascular disease; history of hepatic disease or abnormal liver function tests; pheochromocytoma; renal disease or severe renal impairment

Concurrent use of sympathomimetics (including amphetamines, cocaine, dopamine, epinephrine, methylphenidate, norepinephrine, or phenylephrine) and related compounds (methyldopa, levodopa, phenylalanine, tryptophan, or tyrosine), as well as ophthalmic alpha$_2$-agonists (apraclonidine, brimonidine); may result in behavioral and neurologic symptoms

CNS depressants, cyclobenzaprine, dextromethorphan, ethanol, meperidine, bupropion, buspirone; may result in delirium, excitation, hyper-/hypotension, hyperpyrexia, seizures, and coma

Isocarboxazid **initiation**: At least 2 weeks should elapse between the discontinuation of serotoninergic agents (including SSRIs and tricyclics) and the initiation of isocarboxazid; at least 5 weeks should elapse between the discontinuation of fluoxetine and the initiation of isocarboxazid; at least 1 week should elapse between the discontinuation of other monoamine oxidase (MAO) inhibitors and the initiation of isocarboxazid (using half the normal starting dose). In all cases, a sufficient amount of time must be allowed for the clearance of the serotoninergic agent and any active metabolites prior to the initiation of isocarboxazid.

Isocarboxazid **discontinuation**: At least 2 weeks should elapse between the discontinuation of isocarboxazid and the initiation of the following agents: Serotoninergic agents (including SSRIs, fluoxetine, and tricyclics), bupropion, and other antidepressants. Two to 3 weeks should elapse between the discontinuation of isocarboxazid and the initiation of meperidine. At least 10 days should elapse between the discontinuation of isocarboxazid and initiation of buspirone. At least 1 week should elapse between the discontinuation of isocarboxazid and the initiation of other MAO inhibitors (see specific agent for details).

Antihypertensive agents (including thiazide diuretics): may result in potentiation of antihypertensive effects.

General anesthesia, spinal anesthesia (hypotension may be exaggerated). Use caution with local anesthetics containing sympathomimetic agents. Discontinue drug 10 days prior to elective surgery.

Foods high in tyramine or dopamine content; foods and/or supplements containing tyrosine, phenylalanine, tryptophan, or caffeine; may result in hypertensive reactions.

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Isocarboxazid is FDA approved for the treatment of depression in children ≥16 years of age.**

  The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Isocarboxazid is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Hypertensive crisis: May occur with foods/supplements high in tyramine, tryptophan, phenylalanine, or tyrosine content. Treatment with phentolamine is recommended for hypertensive crises.

- Orthostatic hypotension: May cause orthostatic hypotension (especially at dosages >30 mg/day); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; sensitization to the effects of insulin may occur, monitor blood glucose closely.

- Glaucoma: Use with caution in patients with glaucoma.

- Hepatic impairment: Should not be used in patients with a history of liver disease or with abnormal liver function tests.

- Renal impairment: Use with caution in patients with renal impairment. Should not be used in patients with severe impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism.

Concurrent drug therapy issues:

- High potential for interactions: Do not use with other MAO inhibitors or antidepressants. Avoid products containing sympathomimetic stimulants, dextromethorphan, disulfiram, and meperidine. Concurrent use with antihypertensive agents may lead to exaggeration of hypotensive effects.

Special populations:

- Elderly: The MAO inhibitors are effective and generally well tolerated by older patients. It is the potential interactions with tyramine-containing foods and other drugs, and their effects on blood pressure that have limited their use.

- Pediatrics: Safety and efficacy have not been established in patients <16 years of age. Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents and young adults. (See major psychiatric warnings).

- Hyperactive or agitated patients: Use with caution in patients who are hyperactive and/or hyperexcitable.

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

- Isocarboxazid is **not** indicated for initial therapy, but should be reserved for patients who have not responded to other antidepressants.

- Myelography: Discontinue at least 48 hours prior to myelography.

Geriatric ConsiderationsThe MAO inhibitors are effective and generally well tolerated by elderly patients. It is their potential interactions with tyramine-containing foods and other drugs and their effects on blood pressure that have limited their use. The MAO inhibitors are usually reserved for patients who do not tolerate or respond to the traditional "cyclic" or "second generation" antidepressants. The brain activity of monoamine oxidase increases with age and even more so in patients with Alzheimer's disease. Therefore, the MAO inhibitor may have an increased role in patients with Alzheimer's disease who are depressed. Information on the use of isocarboxazid in the elderly is limited.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Central nervous system: Dizziness (29%), headache (15%)

1% to 10%:

Cardiovascular: Orthostatic hypotension (4%), syncope (2%), palpitation (2%)

Central nervous system: Sleep disturbance (5%), drowsiness (4%), anxiety (2%), chills (2%), forgetfulness (2%), hyperactivity (2%), lethargy (2%), sedation (2%)

Gastrointestinal: Xerostomia (9%), constipation (7%), nausea (6%), diarrhea (2%)

Genitourinary: Urinary frequency (2%), impotence (2%), urinary hesitancy (1%)

Neuromuscular & skeletal: Tremor (4%), myoclonus (2%), paresthesia (2%)

Miscellaneous: Diaphoresis (2%), heavy feeling (2%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Ataxia, black tongue, coma, hallucination, hematologic changes, hepatitis, SIADH, Parkinsonian syndrome, sexual disturbances, toxic amblyopia

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Linezolid: MAO Inhibitors may enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Lithium: MAO Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (based on CNS depressant effects and potential tyramine content)

Food: Concurrent ingestion of foods rich in tyramine may cause sudden and severe high blood pressure (hypertensive crisis). Avoid tyramine-containing foods with MAO inhibitors. Food’s freshness is also an important concern; improperly stored or spoiled food can create an environment where tyramine concentrations may increase.

Herb/Nutraceuticals: Avoid supplements containing caffeine, tyrosine, tryptophan or phenylalanine. Ingestion of large quantities may increase the risk of severe side effects (eg, hypertensive reactions, serotonin syndrome).

Monitoring Parameters

Blood pressure, heart rate; mood, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 10 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Marplan)

10 mg (30): $71.99

Mechanism of ActionThought to act by increasing endogenous concentrations of epinephrine, norepinephrine, dopamine, and serotonin through inhibition of the enzyme (monoamine oxidase) responsible for the breakdown of these neurotransmitters

Related Information

- Antidepressant Agents
- Teratogenic Risks of Psychotropic Medications
- Tyramine Content of Foods

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension, xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAttempts should be made to avoid use of vasoconstrictor due to possibility of hypertensive episodes with monoamine oxidase inhibitors

Mental Health CommentNot commonly used due to a required low tyramine diet and drug-drug interactions. It is estimated that 20 mg of tranylcypromine = 40 mg of isocarboxazid = 45 mg phenelzine. Phenelzine and isocarboxazid are hydrazine MAO inhibitors and tranylcypromine is a nonhydrazine. These drugs produce irreversible inhibition of MAO inhibitors. The half-life for regeneration is 2-3 days. Therefore, a 2-week period is required when switching from an MAO inhibitor to another antidepressant.

While hypertension and hypertensive crisis are risks associated with MAO inhibitor therapy, orthostatic hypotension may also occur. Orthostasis associated with MAO inhibitor therapy is not related to alpha$_1$-adrenergic receptor blockade. The “false transmitter” concept is used to explain this side effect. This concept states that MAO inhibitors promote gradual accumulation in sympathetic nerve ending of amines lacking direct sympathomimetic activity (octopamine) at the expense of the normal synaptic transmitter, norepinephrine. Since octopamine has little ability to activate either alpha- or beta-adrenergic receptors, a functional impairment of sympathetic neurotransmission occurs.

The MAO inhibitors are usually reserved for patients who do not tolerate or respond to other antidepressants. The brain activity of monoamine oxidase increases with age and even more so in patients with Alzheimer's disease. Therefore, the MAO inhibitors may have an increased role in patients with Alzheimer's disease who are depressed. Phenelzine is less stimulating than tranylcypromine.

Medication Safety Issues

Sound-alike/look-alike issues:

Isoflurane may be confused with enflurane, isoflurophate

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(eye soe FLURE ane)

U.S. Brand NamesForane®; Terrell™

Canadian Brand NamesForane®

Pharmacologic CategoryGeneral Anesthetic, Inhalation

Use: Labeled IndicationsInduction and maintenance of general anesthesia

Dosing: Adults**Anesthesia:** Inhalation: Minimum alveolar concentration (MAC), the concentration at which 50% of patients do not respond to surgical incision, is 1.15% (44 years of age) for isoflurane.

Induction: 1.5% to 3%

Maintenance: In nitrous oxide: 1% to 2.5%; in oxygen: 1.5% to 3.5%

Dosing: ElderlyMAC is reduced in the elderly.

Administration: InhalationVia isoflurane-specific calibrated vaporizer

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to isoflurane or any component of the formulation; known or suspected history of malignant hyperthermia

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular effects: Decrease in blood pressure is dose dependent due to peripheral vasodilation primarily in skin and muscle; cardiac output is maintained. May produce cardiac steal (due to coronary vasodilation) in patients with hypertension under certain conditions (eg, unusual coronary artery anatomy). May produce reflex tachycardia, but has less potential to alter atrioventricular conduction or sensitize the myocardium to epinephrine-induced arrhythmias compared to other inhaled anesthetics (eg. halothane, enflurane).

- Decreased blood flow: May cause decrease in hepatic, renal and splenic blood flow.

- Hepatitis: Postoperative hepatic dysfunction and hepatitis have rarely been reported. Postmarketing reports of hepatic failure and necrosis have also been rarely associated with isoflurane.

- Hyperkalemia: Use of other inhaled anesthetics has been associated with rare cases of perioperative hyperkalemia; concomitant use of succinylcholine was associated with many of the reported cases, but not all. Risk of hyperkalemia is increased in pediatric patients with underlying neuromuscular disease (eg, Duchenne muscular dystrophy). Other abnormalities may include elevation in CPK and myoglobinuria. Monitor closely for arrhythmias. Aggressively identify and treat hyperkalemia.

- Increased intracranial pressure: Dilates the cerebral vasculature and may, in certain conditions, increase intracranial pressure.

- Malignant hyperthermia: May trigger malignant hyperthermia; avoid use in patients susceptible to malignant hyperthermia.

- Respiratory depression: Respiration is depressed as is the normal hyperventilatory response to hypoxia. Hypoxic pulmonary vasoconstriction is depressed which may lead to pulmonary shunt. Hypoxemia-induced increase in ventilation is abolished at low concentrations. Can produce elevated carbon monoxide levels in the presence of a dry carbon dioxide absorbent within the circle breathing system of an anesthetic machine.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated adverse fetal effects. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsPotential safety issues exist for occupational exposure to inhaled anesthetic gases (primarily nitrous oxide). Although there are no documented adverse effects of chronic occupational exposure to halogenated anesthetic vapors, like isoflurane, some epidemiological studies suggest a link between these anesthetics and increased health problems (particularly spontaneous abortion). No conclusive relationship has been determined, but the National Institute for Occupational Safety and Health Administration (NIOSH) recommends no worker be exposed to >2 ppm (ceiling concentrations) over a period of 1 hour. Precautions (eg, adequate ventilation, scavenging-systems, minimizing leaks/spills) can help to lessen any potential risk.

Frequency not defined.

Cardiovascular: Arrhythmia, hypotension, myocardial depression, tachycardia (transient)

Central nervous system: Mood changes (may persist for ≤6 days after administration), cognitive function decreased (may persist for ≤3 days after administration)

Endocrine & metabolic: Cholesterol decreased, hyperglycemia, hyperkalemia (pediatric patients, perioperative)

Gastrointestinal: Ileus, nausea, vomiting

Hepatic: Hepatic dysfunction (mild to severe; rare), hepatitis (rare), alkaline phosphatase decreased

Renal: BUN decreased, creatinine increased

Respiratory: Respiratory depression/arrest; respiratory irritation (coughing, laryngospasms-related to induction)

Miscellaneous: Malignant hyperthermia, shivering

Postmarketing and/or case reports: Hepatic failure (rare), hepatic necrosis (rare)

Metabolism/Transport Effects **Substrate** of CYP2E1 (major); **Inhibits** CYP2B6 (weak)

Drug Interactions

CYP2E1 Inhibitors (Moderate): May decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP2E1 Inhibitors (Strong): May decrease the metabolism of CYP2E1 Substrates. *Risk D: Consider therapy modification*

EPINEPHrine: Inhalational Anesthetics may enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Methylphenidate: May enhance the hypertensive effect of Inhalational Anesthetics. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): Inhalational Anesthetics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, heart rate and rhythm, serum potassium, oxygen saturation, end-tidal CO_2 and isoflurane concentrations should be monitored prior to and throughout anesthesia

Monitoring: Lab TestsSerum potassium should be monitored prior to and throughout anesthesia

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, for inhalation: >99.9% (100 mL, 250 mL)

Forane®: >99.9% (100 mL, 250 mL) [amber-colored bottle]

Forane®: >99.9% (100 mL, 250 mL) [aluminum bottle]

Terrell™: >99.9% (100 mL, 250 mL) [amber-colored bottle]

Generic AvailableYes

Pharmacodynamics/Kinetics

Onset of action: 7-10 minutes (pungent odor limits inhalation rate)

Duration: Emergence time: Depends on blood concentration when discontinued

Metabolism: Hepatic (0.2%)

Excretion: Exhaled gases

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsUse of isoflurane for induction of anesthesia is limited by its pungent odor which may cause breath holding or coughing.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

International issues:

Hydra® [Japan] may be confused with Hydrea®

Pronunciation(eye soe NYE a zid)

Canadian Brand NamesIsotamine®; PMS-Isoniazid

Pharmacologic Category[Antitubercular Agent]()

Use: Labeled IndicationsTreatment of susceptible tuberculosis infections; treatment of latent tuberculosis infection (LTBI)

Dosing: AdultsRecommendations often change due to resistant strains and newly-developed information; consult *MMWR* for current CDC recommendations. Intramuscular injection is available for patients who are unable to either take or absorb oral therapy.

Nontuberculous mycobacterium (*M. kansasii*) (unlabeled use): Oral, I.M.: 5 mg/kg/day (maximum: 300 mg/day) for duration to include 12 months of culture-negative sputum; typically used in combination with ethambutol and rifampin

Treatment of latent tuberculosis infection (LTBI): Oral, I.M.: 300 mg/day or 900 mg twice weekly for 6-9 months in patients who do not have HIV infection (9 months is optimal, 6 months may be considered to reduce costs of therapy) and 9 months in patients who have HIV infection. Extend to 12 months of therapy if interruptions in treatment occur.

Treatment of active TB infection (drug susceptible): Oral, I.M.:

Daily therapy: 5 mg/kg/day given daily (usual dose: 300 mg/day)

Twice weekly or 3 times/week directly observed therapy (DOT): 15 mg/kg (maximum: 900 mg). **Note:** CDC guidelines state that once-weekly therapy (15 mg/kg/dose) may be considered, but only after the first 2 months of initial therapy in HIV-negative patients, and only in combination with rifapentine.

Note: Treatment may be defined by the number of doses administered (eg, "six-month" therapy involves 182 doses of INH and rifampin, and 56 doses of pyrazinamide). Six months is the shortest interval of time over which these doses may be administered, assuming no interruption of therapy.

Note: Concomitant administration of 10-50 mg/day pyridoxine is recommended in malnourished patients or those prone to neuropathy (eg, alcoholics, patients with diabetes)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRecommendations often change due to resistant strains and newly-developed information; consult *MMWR* for current CDC recommendations. Intramuscular injection is available for patients who are unable to either take or absorb oral therapy.

Treatment of latent TB infection (LTBI): Infants and Children: Oral, I.M.: 10 mg/kg/day as a singe dose (maximum: 300 mg/day) or 20-30 mg/kg (maximum: 900 mg/dose) twice weekly for 9 months

Treatment of active TB infection: Infants and Children: Oral, I.M.:

Daily therapy: 10-15 mg/kg/day in 1-2 divided doses (maximum: 300 mg/day)

Twice weekly or 3 times/week directly observed therapy (DOT): 20-40 mg/kg (maximum: 900 mg)

Dosing: Renal ImpairmentNo adjustment necessary

Hemodialysis: Dialyzable (50% to 100%); administer dose postdialysis

Dosing: Hepatic ImpairmentNo adjustment required, however, use with caution, may accumulate and additional liver damage may occur in patients with pre-existing liver disease. For ALT or AST >3 times the ULN: discontinue or temporarily withhold treatment. Treatment with isoniazid for latent tuberculosis infection should be deferred in patients with acute hepatic diseases.

Calculations

- [Creatinine Clearance: Adults]()
- [Creatinine Clearance: Pediatrics]()

Administration: OralShould be administered 1 hour before or 2 hours after meals on an empty stomach.

Dietary ConsiderationsShould be taken 1 hour before or 2 hours after meals on an empty stomach; increase dietary intake of folate, niacin, magnesium. Avoid tyramine-containing foods. Avoid histamine-containing foods.

Storage

Tablet: Store at 20°C to 25°C (68°F to 77°F). Protect from light.

Oral solution: Store at 15°C to 30°C (59°F to 86°F). Protect from light.

Extemporaneously PreparedA 10 mg/mL oral suspension was stable for 21 days when refrigerated when compounded as follows:

Triturate ten 100 mg tablets in a mortar, reduce to a fine powder, then add 10 mL of purified water U.S.P. to make a paste; then transfer to a graduate and qs to 100 mL with sorbitol (do not use sugar-based solutions)

Shake well before using and keep in refrigerator

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 3rd ed, Cincinnati, OH: Harvey Whitney Books Co, 1997.

ContraindicationsHypersensitivity to isoniazid or any component of the formulation; acute liver disease; previous history of hepatic damage during isoniazid therapy; previous severe adverse reaction (drug fever, chills, arthritis) to isoniazid

Allergy Considerations

- Isoniazid Allergy

Warnings/Precautions

Boxed warnings:

- Hepatitis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hepatitis: **[U.S. Boxed Warning]: Severe and sometimes fatal hepatitis may occur; usually occurs within the first 3 months of treatment, although may develop even after many months of treatment.** The risk of developing hepatitis is age-related; daily ethanol consumption may also increase the risk. Patients must report any prodromal symptoms of hepatitis, such as fatigue, weakness, malaise, anorexia, nausea, or vomiting.

- Peripheral neuropathies: Pyridoxine (10-50 mg/day) is recommended in individuals at risk for development of peripheral neuropathies (eg, HIV infection, nutritional deficiency, diabetes, pregnancy).

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment. Treatment with isoniazid for latent tuberculosis infection should be deferred in patients with acute hepatic diseases.

- Renal impairment: Use with caution in patients with severe renal impairment.

Other warnings/precautions:

- Appropriate use: Multidrug regimens should be utilized for the treatment of active tuberculosis to prevent the emergence of drug resistance.

- Ophthalmic exams: Periodic ophthalmic examinations are recommended even when usual symptoms do not occur.

Geriatric ConsiderationsAge has not been shown to affect the pharmacokinetics of INH since acetylation phenotype determines clearance and half-life, acetylation rate does not change significantly with age. Most strains of *M. tuberculosis* found the elderly should be susceptible to INH since most acquired their initial infection prior to INH's introduction.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIsoniazid was found to be embryocidal in animal studies; teratogenic effects were not noted. Isoniazid crosses the human placenta. Due to the risk of tuberculosis to the fetus, treatment is recommended when the probability of maternal disease is moderate to high. The CDC recommends isoniazid as part of the initial treatment regimen (CDC, 2003). Pyridoxine supplementation is recommended (25 mg/day).

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsSmall amounts of isoniazid are excreted in breast milk. However, women with tuberculosis should not be discouraged from breast-feeding. Pyridoxine supplementation is recommended for the mother and infant.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, palpitation, tachycardia, vasculitis

Central nervous system: Depression, dizziness, encephalopathy, fever, lethargy, memory impairment, psychosis, seizure, slurred speech

Dermatologic: Flushing, rash (morbilliform, maculopapular, pruritic, or exfoliative)

Endocrine & metabolic: Gynecomastia, hyperglycemia, metabolic acidosis, pellagra, pyridoxine deficiency

Gastrointestinal: Anorexia, nausea, stomach pain, vomiting

Hematologic: Agranulocytosis, anemia (sideroblastic, hemolytic, or aplastic), eosinophilia, thrombocytopenia

Hepatic: LFTs mildly increased (10% to 20%); hyperbilirubinemia, bilirubinuria, jaundice, hepatic dysfunction, hepatitis (may involve progressive liver damage; risk increases with age; 2.3% in patients >50 years)

Neuromuscular & skeletal: Arthralgia, hyper-reflexia, peripheral neuropathy (dose-related incidence, 10% to 20% incidence with 10 mg/kg/day), weakness

Ocular: Blurred vision, loss of vision, optic neuritis and atrophy

Miscellaneous: Lupus-like syndrome, lymphadenopathy, rheumatic syndrome

Metabolism/Transport Effects **Substrate** of CYP2E1 (major); **Inhibits** CYP1A2 (weak), 2A6 (moderate), 2C9 (weak), 2C19 (strong), 2D6 (moderate), 2E1 (moderate), 3A4 (strong); **Induces** CYP2E1 (after discontinuation) (weak)

Drug Interactions

Acetaminophen: Isoniazid may enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Isoniazid may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: Isoniazid may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Chlorzoxazone: Isoniazid may decrease the metabolism of Chlorzoxazone. *Risk C: Monitor therapy*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

CycloSERINE: May enhance the CNS depressant effect of Isoniazid. *Risk D: Consider therapy modification*

CYP2A6 Substrates: CYP2A6 Inhibitors (Moderate) may decrease the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP2E1 Substrates: CYP2E1 Inhibitors (Moderate) may decrease the metabolism of CYP2E1 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Phenytoin: Isoniazid may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May enhance the hepatotoxic effect of Isoniazid. Even so, this is a frequently employed combination regimen. *Risk C: Monitor therapy*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Theophylline Derivatives: Isoniazid may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (increases the risk of hepatitis).

Food: Isoniazid should not be taken with food; serum levels may be decreased if taken with food. Has some ability to inhibit tyramine metabolism; several case reports of mild reactions (flushing, palpitations) after ingestion of cheese (with or without wine). Reactions resembling allergic symptoms following ingestion of fish high in histamine content have been reported. Isoniazid decreases folic acid absorption. Isoniazid alters pyridoxine metabolism.

Test InteractionsFalse-positive urinary glucose with Clinitest®

Monitoring ParametersBaseline and periodic (more frequently in patients with higher risk for hepatitis) liver function tests (ALT and AST); sputum cultures monthly (until 2 consecutive negative cultures reported); monitoring for prodromal signs of hepatitis

Reference RangeTherapeutic: 1-7 mcg/mL (SI: 7-51 µmol/L); Toxic: 20-710 mcg/mL (SI: 146-5176 µmol/L)

Nursing: Physical Assessment/MonitoringUse caution with pre-existing renal impairment or hepatic disease. Assess potential for interactions with other pharmacological or herbal agents patient may be taking (eg, risk of toxicity, decreased effects). Evaluate results of laboratory tests, therapeutic effectiveness, and adverse response (eg, nausea, vomiting, peripheral neuropathy, liver damage, CNS changes) at regular intervals during therapy. Advise patients with diabetes about use of Clinitest® (may cause false-positive results). Teach patient proper use, possible side effects/appropriate interventions (eg, diet [see Tyramine Foods List], ophthalmic examinations), and adverse symptoms to report.

Monitoring: Lab TestsBaseline and periodic (more frequently in patients with higher risk for hepatitis) liver function tests (ALT and AST); sputum cultures monthly (until 2 consecutive negative cultures reported)

Patient EducationDo not take any new prescription, OTC medications, or herbal products during therapy unless approved by prescriber. Best if taken on an empty stomach, 1 hour before or 2 hours after meals. Avoid missing any dose and do not discontinue without notifying prescriber. Avoid excessive alcohol and tyramine-containing foods (eg, aged cheese, broad beans, dry sausage, preserved meats or sausages, liver pate, fish, soy bean, protein supplements, wine) and increase dietary intake of folate, niacin, and magnesium. May cause false test results with Clinitest®; use of another type of glucose testing is preferable. You will need to have frequent ophthalmic exams and periodic medical check-ups to evaluate drug effects. You may experience nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain, rapid heart beat, or palpitations; tingling, numbness, or loss of sensation in hands or feet; unusual weakness or fatigue; persistent gastrointestinal upset; dark-colored urine or change in urinary pattern; yellowing skin or eyes; change in color of stool; change in vision; skin rash; or other persistent adverse effects. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 100 mg/mL (10 mL)

Oral solution: 50 mg/5 mL (473 mL) [orange flavor]

Tablet: 100 mg, 300 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Syrup (Isoniazid)

50 mg/5 mL (473): $68.73

Tablets (Isoniazid)

100 mg (30): $8.99

300 mg (90): $17.00

Mechanism of ActionUnknown, but may include the inhibition of mycolic acid synthesis resulting in disruption of the bacterial cell wall

Pharmacodynamics/Kinetics

Absorption: Rapid and complete; rate can be slowed with food

Distribution: All body tissues and fluids including CSF; crosses placenta; enters breast milk

Protein binding: 10% to 15%

Metabolism: Hepatic with decay rate determined genetically by acetylation phenotype

Half-life elimination: Fast acetylators: 30-100 minutes; Slow acetylators: 2-5 hours; may be prolonged with hepatic or severe renal impairment

Time to peak, serum: 1-2 hours

Excretion: Urine (75% to 95%); feces; saliva

Pharmacotherapy PearlsThe AAP recommends that pyridoxine supplementation (1-2 mg/kg/day) should be administered to malnourished patients, children or adolescents on meat or milk-deficient diets, breast-feeding infants, and those predisposed to neuritis to prevent peripheral neuropathy; administration of isoniazid syrup has been associated with diarrhea

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness or dizziness; may rarely cause depression or psychosis; reports of insomnia, restlessness, disorientation, hallucinations, delusions, obsessive-compulsive symptoms, and exacerbation of schizophrenia

Mental Health: Effects on Psychiatric Treatment Isoniazid may impair the metabolism of carbamazepine and oxidatively metabolized benzodiazepines; monitor for adverse effects

Index Terms INH; Isonicotinic Acid Hydrazide

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Isuprel® may be confused with Disophrol®, Ismelin®, Isordil®

Pronunciation(eye soe proe TER e nole)

U.S. Brand NamesIsuprel®

Pharmacologic CategoryBeta$_1$/Beta$_2$ Agonist

Use: Labeled IndicationsVentricular arrhythmias due to AV nodal block; hemodynamically compromised bradyarrhythmias or atropine- and dopamine-resistant bradyarrhythmias (when transcutaneous/venous pacing is not available); temporary use in third-degree AV block until pacemaker insertion

Use: Unlabeled/InvestigationalPharmacologic overdrive pacing for torsade de pointes; diagnostic aid (vasovagal syncope)

Dosing: AdultsCardiac arrhythmias: I.V.: Initial: 2 mcg/minute; titrate to patient response (2-10 mcg/minute)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricCardiac arrhythmias: I.V.: Start 0.1 mcg/kg/minute (usual effective dose 0.2-2 mcg/kg/minute)

Administration: I.V.I.V. infusion administration requires the use of an infusion pump. To prepare for infusion: 1 mg isoproterenol to 500 mL D_5W, final concentration 2 mcg/mL

Administration: I.V. DetailpH: 2.5-4.5

StorageIsoproterenol solution should be stored at room temperature. It should not be used if a color or precipitate is present. Exposure to air, light, or increased temperature may cause a pink to brownish pink color to develop.

ReconstitutionStability of parenteral admixture at room temperature (25°C) or at refrigeration (4°C) is 24 hours.

Standard diluent: 2 mg/500 mL D_5W; 4 mg/500 mL D_5W.

Minimum volume: 1 mg/100 mL D_5W.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5\,{}^1/_4$ NS, $D_5\,{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, ${}^1/_2NS$, NS; **incompatible** with sodium bicarbonate 5% and alkaline solutions.

Y-site administration: Compatible: Amiodarone, atracurium, bretylium, cisatracurium, famotidine, heparin, hydrocortisone sodium succinate, inamrinone, levofloxacin, milrinone, pancuronium, potassium chloride, propofol, remifentanil, tacrolimus, vecuronium, vitamin B complex with C.

Compatibility in syringe: Compatible: Ranitidine.

Compatibility when admixed: Compatible: Atracurium, calcium chloride, cimetidine, dobutamine, floxacillin, heparin, magnesium sulfate, multivitamins, potassium chloride, ranitidine, succinylcholine, verapamil, vitamin B complex with C. **Incompatible:** Aminophylline, furosemide, sodium bicarbonate.

ContraindicationsHypersensitivity to sulfites or isoproterenol, any component of the formulation, or other sympathomimetic amines; angina, pre-existing cardiac arrhythmias (ventricular); tachycardia or AV block caused by cardiac glycoside intoxication

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Appropriate use: Use with extreme caution; not currently a treatment of choice. Excessive or prolonged use may result in decreased effectiveness.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Cardiovascular: Premature ventricular beats, bradycardia, hyper-/hypotension, chest pain, palpitation, tachycardia, ventricular arrhythmia, MI size increased

Central nervous system: Headache, nervousness or restlessness

Endocrine & metabolic: Serum glucose increased, serum potassium decreased, hypokalemia

Gastrointestinal: Nausea, vomiting

Respiratory: Dyspnea

Drug Interactions

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid ephedra, yohimbe (may cause CNS stimulation).
Monitoring ParametersECG, heart rate, respiratory rate, arterial blood gas, arterial blood pressure, CVP; serum glucose, serum potassium, serum magnesium
Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, cardiac, respiratory, and hemodynamic status when used in acute or emergency situations. Assess knowledge/teach patient appropriate use and administration procedures and adverse reactions to report.
Monitoring: Lab TestsECG, arterial blood gas, serum magnesium, serum potassium, serum glucose (in selected patients)
Patient EducationYou may experience nervousness, dizziness, or fatigue (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth, nausea, or vomiting (small frequent meals may reduce the incidence of nausea or vomiting). If you have diabetes, check blood sugar; blood glucose level may be increased. Report chest pain, rapid heartbeat or palpitations, unresolved/persistent GI upset, dizziness, fatigue, trembling, increased anxiety, sleeplessness, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride:

Isuprel®: 0.2 mg/mL (1:5000) (1 mL, 5 mL) [contains sodium metabisulfite]

Generic AvailableNo
Mechanism of ActionStimulates beta$_1$- and beta$_2$-receptors resulting in relaxation of bronchial, GI, and uterine smooth muscle, increased heart rate and contractility, vasodilation of peripheral vasculature
Pharmacodynamics/Kinetics

Onset of action: Bronchodilation: I.V.: Immediate

Duration: I.V.: 10-15 minutes

Metabolism: Via conjugation in many tissues including hepatic and pulmonary

Half-life elimination: 2.5-5 minutes

Excretion: Urine (primarily as sulfate conjugates)

Related Information

- Bronchodilators
- Hemodynamic Support, Intravenous
- Inhalant Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsIsoproterenol is selective for beta-adrenergic receptors and not alpha-receptors; therefore, there is no precaution in the use of vasoconstrictor such as epinephrine
Mental Health: Effects on Mental StatusInsomnia and restlessness are common
Mental Health: Effects on Psychiatric TreatmentNone reported
Cardiovascular ConsiderationsIsoproterenol is being increasingly used for provoking vasovagal syncope during tilt table testing. Incremental doses of isoproterenol are used in patients with a history suggestive of vasovagal syncope but in whom upright tilt alone does not induce symptoms. Another important use for isoproterenol is in the intensive care setting in the treatment of torsade de pointes. In patients with recurrent torsade de pointes, treatment consists of correcting underlying cause (eg, electrolyte abnormalities or drug ingestion). Supportive therapy consists of increasing heart rate so as to decrease the QT interval. This can be achieved by either placement of a temporary external pacemaker or by incremental isoproterenol infusion to achieve a resting heart rate of approximately 100 beats per minute or a resting heart rate that is not conducive to the occurrence of torsade de pointes.

Isoproterenol may be used together with atropine as a temporizing measure in treating patients with hemodynamically significant bradycardia.

Study data suggest that elderly healthy or hypertensive patients are less responsive to beta-adrenergic stimulation compared to younger subjects. Use caution in elderly patients; start dosing at the lower end of the dosing range.

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Isoproterenol can be effective in terminating torsade de pointes associated with bradycardia and drug-induced prolonged QT (adult case series; Keren, 1981).

Index Terms Isoproterenol Hydrochloride

Isosorbide Dinitrate and Hydralazine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation (eye soe SOR bide dye NYE trate & hye DRAL a zeen)

U.S. Brand Names BiDil®

Pharmacologic Category [Vasodilator]

Use: Labeled Indications Treatment of heart failure, adjunct to standard therapy, in self-identified African-Americans

Dosing: Adults **Heart failure:** Oral: Initial: 1 tablet 3 times/day; titrate to a maximum dose of 2 tablets 3 times/day

Dosing: Elderly Refer to adult dosing.

Dosing: Adjustment for Toxicity If patient experiences persistent headache, adjust dosing to twice daily.

Storage Store at controlled room temperature of 15°C to 30°C (58°F to 86°F). Protect from light.

Contraindications Hypersensitivity to isosorbide dinitrate, hydralazine, or any component of the formulation; hypersensitivity to organic nitrates; concurrent use with phosphodiesterase-5 inhibitors (sildenafil, tadalafil, or vardenafil); angle-closure glaucoma (intraocular pressure may be increased); head trauma or cerebral hemorrhage (increase intracranial pressure); severe anemia; mitral valve rheumatic heart disease

Warnings/Precautions

Concerns related to adverse effects:

- Drug-induced lupus-like syndrome: Hydralazine may cause a drug-induced lupus-like syndrome (more likely on larger doses, longer duration).
- Fluid/sodium retention: Hydralazine-induced fluid and sodium retention may require addition or increased dosage of a diuretics.
- Hypotension/bradycardia: Severe hypotension can occur; paradoxical bradycardia and increased angina pectoris can accompany hypotension. Postural hypotension can also occur. Use with caution in volume depletion, hypotension, and right ventricular infarctions.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease (CAD); increase in tachycardia may increase myocardial oxygen demand.
- Hypertrophic cardiomyopathy: Use with caution in patients with hypertrophic cardiomyopathy; nitrates may reduce preload, exacerbating obstruction and cause hypotension and/or worsening of heart failure.
- Pulmonary hypertension: Use with caution in pulmonary hypertension; may cause hypotension.
- Renal impairment: Use with caution in patients with severe renal impairment; dosage adjustment recommended.

Concurrent drug therapy issues:

- PDE-5 inhibitors: Avoid concurrent use with PDE-5 inhibitors (eg, sildenafil, tadalafil, vardenafil).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Tolerance: Appropriate dosing is needed to minimize tolerance development.

Geriatric Considerations The pharmacokinetics of hydralazine and isosorbide alone or in combination have not been studied. As with all antihypertensives and nitrate products, caution should be used on initiation of therapy, as hypotension may be encountered. Since many elderly are volume depleted, secondary to their blunted thirst reflex and/or use of diuretics, doses used initially should be at lowest recommended dose. The use of nitrates may occasionally promote reflux esophagitis. Monitor for these effects at start of therapy.

Pregnancy Risk Factor C

Pregnancy Considerations See individual agents.

Lactation See individual agents.

Breast-Feeding Considerations See individual agents.

Adverse Reactions The following events were reported in the A-HeFT Study using the combination isosorbide dinitrate/hydralazine product. See individual drug monographs for additional information.

>10%:

Cardiovascular: Chest pain (16%)

Central nervous system: Headache (50%), dizziness (32%)

Neuromuscular & skeletal: Weakness (14%)

1% to 10%:

Cardiovascular: Hypotension (8%), ventricular tachycardia (4%), palpitation (4%), tachycardia (2%)

Dermatologic: Alopecia (1%), angioedema (1%)

Endocrine & metabolic: Hyperglycemia (4%), hyperlipidemia (3%), hypercholesterolemia (1%)

Gastrointestinal: Nausea (10%), vomiting (4%)

Hepatic: Cholecystitis (1%)

Neuromuscular & skeletal: Paresthesia (4%), arthralgia (1%), myalgia (1%), tendon disorder (1%)

Respiratory: Bronchitis (8%), sinusitis (4%), rhinitis (4%)

Miscellaneous: Allergic reaction (1%), diaphoresis (1%)

Metabolism/Transport Effects Hydralazine: **Inhibits** CYP3A4 (weak); Isosorbide dinitrate: **Substrate** of CYP3A4 (major)

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the vasodilatory effect of Vasodilators (Organic Nitrates). *Risk X: Avoid combination*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rosiglitazone: Vasodilators (Organic Nitrates) may enhance the adverse/toxic effect of Rosiglitazone. Specifically, a greater risk of myocardial ischemia was reported for users of this combination in a meta-analysis. Management: Consider alternatives to this combination when possible. Rosiglitazone prescribing information states that the combination of rosiglitazone and a nitrate is not recommended. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring Parameters

Blood pressure (standing and sitting/supine), heart rate, ANA titers

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Isosorbide dinitrate 20 mg and hydralazine 37.5 mg

Generic AvailableNo

Manufacturer

NitroMed, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (BiDil)

20-37.5 mg (30): $63.99

Mechanism of Action

Hydralazine: Direct vasodilation of arterioles (with little effect on veins) resulting in decreased systemic resistance

Isosorbide Dinitrate: Nitric oxide release causes stimulation of intracellular guanylyl cyclase leading to increased cyclic GMP. This results in vascular smooth muscle relaxation of both arterial and venous vasculature. Increased venous pooling decreases left ventricular pressure (preload) and arterial dilatation decreases arterial resistance (afterload). Therefore, this reduces cardiac oxygen demand by decreasing left ventricular pressure and systemic vascular resistance by dilating arteries. Additionally, coronary artery dilation improves collateral flow to ischemic regions.

Pharmacodynamics/Kinetics The following values are from administration of isosorbide dinitrate 40 mg and hydralazine 75 mg in healthy adults. Also see individual drug monographs.
Half-life elimination: Hydralazine: 4 hours; Isosorbide dinitrate: 2 hours

Time to peak, plasma: 1 hour (both agents)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness
Mental Health: Effects on Psychiatric TreatmentConcomitant use with MAO inhibitors may result in large decreases in blood pressure; monitor

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Isordil® may be confused with Inderal®, Isuprel®

International issues:

Nitrobide® [Japan] may be confused with Microzide® which is a brand name for hydrochlorothiazide in the U.S.

Pronunciation(eye soe SOR bide dye NYE trate)

U.S. Brand NamesDilatrate®-SR; Isochron™; Isordil®

Canadian Brand NamesApo-ISDN®; Cedocard®-SR; Coronex®; Novo-Sorbide; PMS-Isosorbide

Pharmacologic CategoryVasodilator

Use: Labeled IndicationsPrevention and treatment of angina pectoris; for congestive heart failure; to relieve pain, dysphagia, and spasm in esophageal spasm with GE reflux

Use: Unlabeled/InvestigationalEsophageal spastic disorders

Dosing: Adults

Angina:

Oral: 5-40 mg 4 times/day or 40 mg every 8-12 hours in sustained released dosage form

Sublingual: 2.5-5 mg every 5-10 minutes for maximum of 3 doses in 15-30 minutes; may also use prophylactically 15 minutes prior to activities which may provoke an attack

Congestive heart failure:

Initial dose: 20 mg 3-4 times/day

Target dose: 120-160 mg/day in divided doses; use in combination with hydralazine

Esophageal spastic disorders (unlabeled use):

Oral: 5-10 mg before meals

Sublingual: 2.5 mg after meals

Note: Tolerance to nitrate effects develops with chronic exposure. Dose escalation does not overcome this effect. Tolerance can only be overcome by short periods of nitrate absence from the body. Short periods (10-12 hours) of nitrate withdrawal help minimize tolerance. General recommendations are to take the last dose of short-acting agents no later than 7 PM; administer 2-3 times/day rather than 4 times/day. Sustained release preparations could be administered at times to allow a 15- to 17-hour interval between first and last daily dose. Example: Administer sustained release at 8 AM and 2 PM for a twice daily regimen.

Dosing: ElderlyElderly patients should be given lowest recommended adult daily doses initially and titrate upward.

Dosing: Renal ImpairmentHemodialysis: During hemodialysis, administer dose postdialysis or administer supplemental 10-20 mg dose. During peritoneal dialysis, supplemental dose is not necessary.

Administration: OralDo not administer around-the-clock; the first dose of nitrates should be administered in a physician's office to observe for maximal cardiovascular dynamic effects and adverse effects (orthostatic blood pressure drop, headache); when immediate release products are prescribed twice daily (recommend 7 AM and noon); for 3 times/day dosing (recommend 7 AM, noon, and 5 PM); when sustained-release products are indicated, suggest once a day in morning or via twice daily dosing at 8 AM and 2 PM. Do not crush sublingual tablets.

ContraindicationsHypersensitivity to isosorbide dinitrate or any component of the formulation; hypersensitivity to organic nitrates; concurrent use with phosphodiesterase-5 (PDE-5) inhibitors (sildenafil, tadalafil, or vardenafil); angle-closure glaucoma (intraocular pressure may be increased); head trauma or cerebral hemorrhage (increase intracranial pressure); severe anemia

Allergy Considerations

- Nitrate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension/bradycardia: Severe hypotension can occur; paradoxical bradycardia and increased angina pectoris can accompany hypotension. Postural hypotension can also occur. Use with caution in volume depletion, hypotension, and right ventricular infarctions.

Disease-related concerns:

- Hypertrophic cardiomyopathy: Use with caution in patients with hypertrophic cardiomyopathy; nitrates may reduce preload, exacerbating obstruction and cause hypotension and/or worsening of heart failure.

Concurrent drug therapy issues:

- PDE-5 inhibitors: Avoid concurrent use with PDE-5 inhibitors (eg, sildenafil, tadalafil, vardenafil).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Tolerance: Appropriate dosing is needed to minimize tolerance development.

Geriatric ConsiderationsThe first dose of nitrates (sublingual, chewable, oral) should be taken in a physician's office to observe for maximal cardiovascular dynamic effects and adverse effects (eg, orthostatic blood pressure drop, headache). The use of nitrates for angina may occasionally promote reflux esophagitis. This may require dose adjustments or changing therapeutic agents to correct this adverse effect.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension (infrequent), postural hypotension, crescendo angina (uncommon), rebound hypertension (uncommon), pallor, cardiovascular collapse, tachycardia, shock, flushing, peripheral edema, syncope (uncommon)

Central nervous system: Headache (most common), lightheadedness (related to blood pressure changes), dizziness, restlessness

Gastrointestinal: Nausea, vomiting, bowel incontinence, xerostomia

Genitourinary: Urinary incontinence

Hematologic: Methemoglobinemia (rare, overdose)

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision

Miscellaneous: Cold sweat

The incidence of hypotension and adverse cardiovascular events may be increased when used in combination with sildenafil (Viagra®).

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the vasodilatory effect of Vasodilators (Organic Nitrates). *Risk X: Avoid combination*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rosiglitazone: Vasodilators (Organic Nitrates) may enhance the adverse/toxic effect of Rosiglitazone. Specifically, a greater risk of myocardial ischemia was reported for users of this combination in a meta-analysis. Management: Consider alternatives to this combination when possible. Rosiglitazone prescribing information states that the combination of rosiglitazone and a nitrate is not recommended. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Caution with ethanol (may increase risk of hypotension).

Test InteractionsDecreased cholesterol (S)

Monitoring ParametersMonitor for orthostasis

Nursing: Physical Assessment/MonitoringAssess patient closely for cautious use (eg, volume depletion, hypotension, and right ventricular infarctions). Assess potential for interactions with other pharmacological agents patient may be taking (potential for decreased or increased levels/effect of Isosorbide, additive hypotension), Tolerance does develop to nitrates and appropriate dosing is needed to minimize tolerance (10-12 hours of withdrawal). Assess therapeutic effectiveness and adverse response (eg, hypotension, tolerance) at regular intervals during therapy. When discontinuing, reduce dosage gradually. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of maintaining dosing schedule), and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed, at the same time each day with last dose in early evening. Do not chew or swallow sublingual tablets; allow them to dissolve under your tongue. Do not crush or chew sustained release capsules, swallow whole with 8 oz water. Do not change brands without consulting prescriber. Do not discontinue abruptly. Keep medication in original container, tightly closed. Avoid excessive alcohol; combination may cause severe hypotension. May cause postural hypotension (take medication while sitting down and use caution when rising from sitting or lying position or climbing stairs until response to drug is known); headache, dizziness, weakness, or blurred vision (use caution when driving or engaging in hazardous activities until response to drug is known); or nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). If chest pain occurs, seek emergency medical help at once. Report acute headache, rapid heartbeat, unusual restlessness or dizziness, muscular weakness, or blurring vision. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, sustained release (Dilatrate®-SR): 40 mg

Tablet: 5 mg, 10 mg, 20 mg, 30 mg

Isordil®: 5 mg, 10 mg [DSC], 20 mg [DSC], 30 mg [DSC], 40 mg

Tablet, extended release (Isochron™): 40 mg

Tablet, sublingual: 2.5 mg, 5 mg

Isordil®: 2.5 mg, 5 mg, 10 mg [DSC]

Generic AvailableYes: Tablet, sublingual tablet

Pricing: U.S. (www.drugstore.com)

Sublingual (Isosorbide Dinitrate)

2.5 mg (100): $39.16

5 mg (100): $18.99

Tablet, controlled release (Isosorbide Dinitrate CR)

40 mg (60): $43.45

Tablets (Isordil Titradose)

5 mg (100): $64.50

40 mg (60): $97.18

Tablets (Isosorbide Dinitrate)

5 mg (90): $14.00

10 mg (30): $12.99

20 mg (30): $12.99

Mechanism of ActionStimulation of intracellular cyclic-GMP results in vascular smooth muscle relaxation of both arterial and venous vasculature. Increased venous pooling decreases left ventricular pressure (preload) and arterial dilatation decreases arterial resistance (afterload). Therefore, this reduces cardiac oxygen demand by decreasing left ventricular pressure and systemic vascular resistance by dilating arteries. Additionally, coronary artery dilation improves collateral flow to ischemic regions; esophageal smooth muscle is relaxed via the same mechanism.

Pharmacodynamics/Kinetics

Onset of action: Sublingual tablet: 2-10 minutes; Chewable tablet: 3 minutes; Oral tablet: 45-60 minutes

Duration: Sublingual tablet: 1-2 hours; Chewable tablet: 0.5-2 hours; Oral tablet: 4-6 hours

Metabolism: Extensively hepatic to conjugated metabolites, including isosorbide 5-mononitrate (active) and 2-mononitrate (active)

Half-life elimination: Parent drug: 1-4 hours; Metabolite (5-mononitrate): 4 hours

Excretion: Urine and feces

Related Information

- Heart Failure (Systolic)
- Nitrates

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsNitrates improve the balance between myocardial oxygen supply and demand, primarily by decreasing oxygen demand. Nitrates decrease myocardial oxygen demand by reducing preload via dilation of peripheral veins. Nitrates improve myocardial oxygen supply by dilating epicardial coronary arteries and collateral vessels, leaving resistance vessels alone. Nitrates are unlikely to induce a coronary steal syndrome. Nitrates improve exercise tolerance in stable angina patients. An adequate nitroglycerin-free period must be provided with all nitrate products to prevent nitrate tolerance from developing. Caution should be observed if administering nitrates to individuals who are volume depleted or are experiencing a right ventricular infarction. Additionally, nitrates should not be given to an individual who has received a phosphodiesterase-5 (PDE-5) enzyme inhibitor within the past 24 hours.

Anesthesia and Critical Care Concerns/Other ConsiderationsNitrates used in right ventricular infarction may induce acute hypotension. Nitrate use in severe pericardial effusion may reduce cardiac filling pressure and precipitate cardiac tamponade. In the management of heart failure, the combination of isosorbide dinitrate and hydralazine confers beneficial effects on disease progression and cardiac outcomes.

Special Alerts

Isosorbide Mononitrate Tablets: Recall Due to Potential for Oversized Tablets - November 2008

Certain lots of generic isosorbide mononitrate tablets have been recalled due to possibility of oversized tablets. Oversized tablets may contain up to twice the amount of the active ingredient which may result in serious or life-threatening effects.

For more information, including lots involved, please refer to the FDA MedWatch alert: http://www.fda.gov/medwatch/safety/2008/safety08.htm#Ethex

Medication Safety Issues

Sound-alike/look-alike issues:

Imdur® may be confused with Imuran®, Inderal LA®, K-Dur®

Monoket® may be confused with Monopril®

International issues:

Nitrex® [Italy] may be confused with Imitrex® which is a brand name for sumatriptan in the U.S.

Pronunciation(eye soe SOR bide mon oh NYE trate)

U.S. Brand NamesImdur®; Ismo®; Monoket®

Canadian Brand NamesApo-ISMN®; Imdur®; PMS-ISMN; Pro-ISMN

Pharmacologic CategoryVasodilator

Use: Labeled IndicationsLong-acting metabolite of the vasodilator isosorbide dinitrate used for the prophylactic treatment of angina pectoris

Dosing: Adults

Angina: Oral:

Regular tablet: 5-20 mg twice daily with the two doses given 7 hours apart (eg, 8 AM and 3 PM) to decrease tolerance development; then titrate to 10 mg twice daily in first 2-3 days.

Extended release tablet: Initial: 30-60 mg given in morning as a single dose; titrate upward as needed, giving at least 3 days between increases; maximum daily single dose: 240 mg

Note: Tolerance to nitrate effects develops with chronic exposure. Dose escalation does not overcome this effect. Tolerance can only be overcome by short periods of nitrate absence from the body. Short periods (10-12 hours) of nitrate withdrawal help minimize tolerance. Recommended dosage regimens incorporate this interval. General recommendations are to take the last dose of short-acting agents no later than 7 PM; administer 2 times/day rather than 4 times/day. Administer sustained release tablet once daily in the morning.

Dosing: ElderlyStart with lowest recommended adult dose.

Dosing: Renal ImpairmentNot necessary for elderly or patients with altered renal or hepatic function. Tolerance to nitrate effects develops with chronic exposure.

Administration: OralDo not administer around-the-clock; Monoket® and Ismo® should be scheduled twice daily with doses 7 hours apart (8 AM and 3 PM); Imdur® may be administered once daily. Extended release tablets should not be chewed or crushed. Should be swallowed with a half-glassful of fluid.

StorageTablets should be stored in a tight container at room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to isosorbide or any component of the formulation; hypersensitivity to organic nitrates; concurrent use with phosphodiesterase-5 (PDE-5) inhibitors (sildenafil, tadalafil, or vardenafil); angle-closure glaucoma (intraocular pressure may be increased); head trauma or cerebral hemorrhage (increase intracranial pressure); severe anemia

Allergy Considerations

- Nitrate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension/bradycardia: Severe hypotension can occur; paradoxical bradycardia and increased angina pectoris can accompany hypotension. Orthostatic hypotension can also occur; ethanol can accentuate this. Use with caution in volume depletion, hypotension, and right ventricular infarctions.

Disease-related concerns:

- Hypertrophic cardiomyopathy: Use with caution in patients with hypertrophic cardiomyopathy; nitrates may reduce preload, exacerbating obstruction and cause hypotension and/or worsening of heart failure.

Concurrent drug therapy issues:

- PDE-5 inhibitors: Avoid concurrent use with PDE-5 inhibitors (eg, sildenafil, tadalafil, vardenafil).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Tolerance: Appropriate dosing is needed to minimize tolerance development.

Geriatric ConsiderationsThe first dose of nitrates (sublingual, chewable, oral) should be taken in a physician's office to observe for maximal cardiovascular dynamic effects and adverse effects (eg, orthostatic blood pressure drop, headache). The use of nitrates for angina may occasionally promote reflux esophagitis. This may require dose adjustments or changing therapeutic agents to correct this adverse effect.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse Reactions

>10%: Central nervous system: Headache (19% to 38%)

1% to 10%:

Central nervous system: Dizziness (3% to 5%)

Gastrointestinal: Nausea/vomiting (2% to 4%)

<1% (Limited to important or life-threatening): Angina pectoris, arrhythmia, atrial fibrillation, hypotension, palpitation, postural hypotension, premature ventricular contractions, supraventricular tachycardia, syncope, pruritus, rash, abdominal pain, diarrhea, dyspepsia, tenesmus, tooth disorder, vomiting, dysuria, impotence, urinary frequency, asthenia, blurred vision, cold sweat, diplopia, edema, malaise, neck stiffness, rigors, agitation, anxiety, confusion, dyscoordination, hypoesthesia, nightmares, bronchitis, pneumonia, upper respiratory tract infection, arthralgia, methemoglobinemia (rare, overdose)

The incidence of hypotension and adverse cardiovascular events may be increased when used in combination with sildenafil (Viagra®).

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the vasodilatory effect of Vasodilators (Organic Nitrates). *Risk X: Avoid combination*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rosiglitazone: Vasodilators (Organic Nitrates) may enhance the adverse/toxic effect of Rosiglitazone. Specifically, a greater risk of myocardial ischemia was reported for users of this combination in a meta-analysis. Management: Consider alternatives to this combination when possible. Rosiglitazone prescribing information states that the combination of rosiglitazone and a nitrate is not recommended. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Caution with ethanol (may increase risk of hypotension).

Monitoring ParametersMonitor for orthostasis, increased hypotension

Nursing: Physical Assessment/MonitoringAssess patient closely for cautious use (eg,volume depletion, hypotension, and right ventricular infarctions). Assess potential for interactions with other pharmacological agents patient may be taking (potential for decreased or increased levels/effect of Isosorbide, additive hypotension). Tolerance does develop to nitrates and appropriate dosing is needed to minimize tolerance (10-12 hours of withdrawal). Assess therapeutic effectiveness and adverse response (eg, hypotension, tolerance) at regular intervals during therapy. When discontinuing, reduce dosage gradually. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of maintaining dosing schedule), and adverse symptoms to report.

Monitoring: Lab TestsOrthostasis

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed, at the same time each day with last dose in early evening. Do not chew or swallow sublingual tablets; allow them to dissolve under your tongue. Do not crush or chew sustained release capsules, swallow whole with $^{1}/_{2}$ glass of water. Do not change brands without consulting prescriber. Do not discontinue abruptly. Keep medication in original container, tightly closed. Avoid excessive alcohol; combination may cause severe hypotension. May cause postural hypotension (take medication while sitting down and use caution when rising from sitting or lying position or climbing stairs until response to drug is known); headache, dizziness, weakness, or blurred vision (use caution when driving or engaging in hazardous activities until response to drug is known); or nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). If chest pain occurs, seek emergency medical help at once. Report acute headache, rapid heartbeat, unusual restlessness or dizziness, muscular weakness, or blurring vision. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

20 mg (60): $109.99

Mechanism of ActionPrevailing mechanism of action for nitroglycerin (and other nitrates) is systemic venodilation, decreasing preload as measured by pulmonary capillary wedge pressure and left ventricular end diastolic volume and pressure; the average reduction in left ventricular end diastolic volume is 25% at rest, with a corresponding increase in ejection fractions of 50% to 60%. This effect improves congestive symptoms in heart failure and improves the myocardial perfusion gradient in patients with coronary artery disease.

Pharmacodynamics/Kinetics

Onset of action: 30-60 minutes

Absorption: Nearly complete and low intersubject variability in its pharmacokinetic parameters and plasma concentrations

Metabolism: Hepatic

Half-life elimination: Mononitrate: ~4 hours

Excretion: Urine and feces

Related Information

- Nitrates

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness; may rarely cause drowsiness, agitation, anxiety, confusion, nervousness, or insomnia

Mental Health: Effects on Psychiatric Treatment None reported

Cardiovascular Considerations Nitrates improve the balance between myocardial oxygen supply and demand, primarily by decreasing oxygen demand. Nitrates decrease myocardial oxygen demand by reducing preload via dilation of peripheral veins. Nitrates improve myocardial oxygen supply by dilating epicardial coronary arteries and collateral vessels, leaving resistance vessels alone. Nitrates are unlikely to induce a coronary steal syndrome. Nitrates improve exercise tolerance in stable angina patients. An adequate nitroglycerin-free period must be provided with all nitrate products to prevent nitrate tolerance from developing. Caution should be observed if administering nitrates to individuals who are volume depleted or are experiencing a right ventricular infarction. Additionally, nitrates should not be given to an individual who has received a phosphodiesterase-5 (PDE-5) enzyme inhibitor within the past 24 hours.

Anesthesia and Critical Care Concerns/Other Considerations Nitrates used in right ventricular infarction may induce acute hypotension. Nitrate use in severe pericardial effusion may reduce cardiac filling pressure and precipitate cardiac tamponade.

Pharmacologic CategoryContrast Agent
Use: Labeled IndicationsAdjunct to lymphography for visualization of the lymphatic system; sentinel node identification
Dosing: AdultsLymphography: SubQ: Inject 0.5 mL into 3 interdigital spaces of each extremity per study; maximum: 3 mL (30 mg)
Administration: I.V. DetailpH: 6.8-7.4
Administration: OtherSubQ: Single patient use only; do not mix with local anesthetics (in same syringe)
StorageStore at room temperature. Avoid prolonged exposure to elevated temperatures.
Compatibility**Compatibility in syringe: Incompatible:** Local anesthetics (eg, lidocaine)
ContraindicationsHypersensitivity to isosulfan, triphenylmethane, or any component of the formulation
Warnings/Precautions

Concerns related to adverse events:

- Hypersensitivity reactions: Hypersensitivity reactions, including anaphylactic reactions (rare), may occur; appropriate equipment and emergency medications should be available during use. Competent personnel and emergency facilities should be available during and for at least 60 minutes after administration, since severe delayed reactions may occur. Risk likely higher risk in patients with history of asthma, allergies, drug reactions, including previous sensitivity to triphenylmethane dyes.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Methemoglobin: Methemoglobin levels via ABG may be falsely elevated; co-oximetry may be required to accurately assess.

- Oximetry interference: Peripheral oxygenation measurements may be falsely depressed due to discoloration of serum caused by isosulfan blue; (peak interference 30 minutes after administration; minimal effect by 4 hours postdose); direct determination of arterial blood gases (ABG) may be required.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproductive studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk is unknown/use caution
Adverse Reactions

1% to 10%:

Dermatologic: Pruritus (2%; affecting hands, abdomen and neck)

Local: Administration site swelling (2%)

Miscellaneous: Hypersensitivity reactions (2%)

Postmarketing and/or case reports: Anaphylaxis; body fluid discoloration (urine, serum; may lead to falsely low oximetry readings); skin discoloration (including blue urticaria)

Drug InteractionsThere are no known significant interactions.
Test InteractionsPeripheral oxygenation measurements may be falsely depressed (peak interference 30 minutes after administration; minimal effect by 4 hours postdose). Methemoglobin levels via arterial blood gas analyzer may be falsely elevated.
Nursing: Physical Assessment/MonitoringEvaluate history of allergies, asthma, and previous drug reactions prior to administration. Hypersensitivity reactions can occur. Patient must be closely monitored during and for 1 hour following administration (severe reactions may be delayed). Emergency treatment for anaphylactic reactions should be available. For SubQ injection only.
Patient EducationHypersensitivity reactions can occur. Patient must be closely monitored during and for 1 hour following administration (severe reactions may be delayed). Emergency treatment for anaphylactic reactions should be available. For SubQ injection only; see Administration.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative-free]:

Lymphazurin™: 1% (5 mL)

Generic AvailableNo
ManufacturerUnited States Surgical, a division of Tyco Healthcare Group LP
Mechanism of ActionFollowing subcutaneous administration, isosulfan blue binds to interstitial proteins; these proteins/extracellular

fluids are drained by the regional lymphatic system, resulting in concentration of the dye within the lymph. Bright blue coloration imparted by the dye permits delineation of the vessels against the surrounding tissue.

Pharmacodynamics/Kinetics

Absorption: 34% absorbed in 30 minutes; 69% and 100% in 1 and 24 hours, respectively

Protein binding: ~50%

Excretion: Urine (10%; as unchanged drug); feces (~90%; via biliary excretion)

Pharmacotherapy Pearls May cause blue discoloration of urine for 24 hours.

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Isotretinoin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Accutane® may be confused with Accolate®, Accupril®

Claravis™ may be confused with Cleviprex™

Isotretinoin may be confused with tretinoin

Pronunciation(eye soe TRET i noyn)

U.S. Brand NamesAccutane®; Amnesteem™; Claravis™; Sotret®

Canadian Brand NamesAccutane®; Clarus™; Isotrex®

Pharmacologic CategoryAcne Products; Retinoic Acid Derivative

Use: Labeled IndicationsTreatment of severe recalcitrant nodular acne unresponsive to conventional therapy

Use: Unlabeled/InvestigationalInvestigational: Treatment of children with metastatic neuroblastoma or leukemia that does not respond to conventional therapy

Dosing: AdultsSevere recalcitrant nodular acne: Oral: 0.5-1 mg/kg/day in 2 divided doses (dosages as low as 0.05 mg/kg/day have been reported to be beneficial) for 15-20 weeks or until the total cyst count decreases by 70%, whichever is sooner. Adults with very severe disease/scarring or primarily involves the trunk may require dosage adjustment up to 2 mg/kg/day. A second course of therapy may be initiated after a period of ≥2 months off therapy.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Neuroblastoma (investigational): Oral: Children: Maintenance therapy for neuroblastoma: 100-250 mg/m^2/day in 2 divided doses

Acne (severe recalcitrant nodular): Oral: Children 12-17 years: 0.5-1 mg/kg/day in 2 divided doses (dosages as low as 0.05 mg/kg/day have been reported to be beneficial) for 15-20 weeks or until the total cyst count decreases by 70%, whichever is sooner. A second course of therapy may be initiated after a period of ≥2 months off therapy.

Dosing: Hepatic ImpairmentEmpiric dose reductions are recommended in patient with hepatitis.

Calculations

- Body Surface Area: Pediatrics

Administration: OralAdminister with food. Capsules should be swallowed whole with a full glass of water. For patients unable to swallow, the Accutane® capsule may be pierced with a large-gauge needle and the contents placed in food (cottage cheese, ice cream, pudding, or oatmeal with butter) for immediate consumption (Accutane® data on file, Roche Pharmaceuticals). Use appropriate precautions for handling teratogenic capsule contents.

Dietary ConsiderationsShould be taken with food. Limit intake of vitamin A; avoid use of other vitamin A products. Some formulations may contain soybean oil.

StorageStore at room temperature. Protect from light.

Extemporaneously Prepared

Alternate method of administration of Accutane® capsules, based on unpublished data (not recommended by manufacturer): An oral suspension using the entire capsule may be prepared by adding one 10 mg capsule to 15 mL warm (~37°C or 97°F) 2% reduced-fat milk (or 20 mg capsule to 30 mL, etc, so that the concentration is maintained). Stir until capsule shell dissolves and capsule contents are dispersed throughout solution (approximately 10-15 minutes). Suspension stable for ≤4 hours at controlled room temperature or under refrigeration. Use appropriate precautions for handling teratogenic capsule contents.

Accutane® data on file, Roche Pharmaceuticals

RestrictionsAll patients (male and female), prescribers, wholesalers, and dispensing pharmacists must register and be active in the iPLEDGE™ risk management program, designed to eliminate fetal exposures to isotretinoin. This program covers all isotretinoin products (brand and generic). The iPLEDGE™ program requires that all patients meet qualification criteria and monthly program requirements. Registration, activation, and additional information are provided at www.ipledgeprogram.com or by calling 866-495-0654.

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to isotretinoin or any component of the formulation; sensitivity to parabens, vitamin A, or other retinoids; pregnancy

Allergy Considerations

- Retinoid Allergy

Warnings/Precautions

Boxed warnings:

- Teratogenic effects/iPLEDGE™ program: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Auditory impairment: Hearing impairment, which can continue after therapy is discontinued, may occur. Discontinue therapy if hearing impairment or tinnitus develops.
- Decreased bone mineral density: May decrease bone mineral density; osteoporosis, osteopenia, and bone fractures have been reported with use. Use caution in patients with a genetic predisposition to bone disorders (eg, osteoporosis, osteomalacia) and with disease states or concomitant medications that can induce bone disorders. Patients may be at risk when participating in activities with repetitive impact (such as sports).
- Growth effects: Skeletal hyperostosis and premature epiphyseal closure have also been reported with the use.
- Hepatic effects: Clinical hepatitis and elevated liver enzymes have been reported with use.
- Inflammatory bowel disease: Has been reported with use; discontinue treatment if abdominal pain, rectal bleeding, or severe diarrhea occurs.
- Ocular effects: Vision impairment, corneal opacities, and decreased night vision have also been reported with use.
- Pseudotumor cerebri: Retinoids have been associated with pseudotumor cerebri (benign intracranial hypertension), especially in children. Concurrent use of other drugs associated with this effect (eg, tetracyclines) may increase risk. Early signs and symptoms include papilledema, headache, nausea, vomiting and visual disturbances; discontinue if papilledema occurs.
- Psychiatric effects: May cause depression, psychosis, aggressive or violent behavior, and changes in mood. Rarely, suicidal thoughts and actions have been reported during isotretinoin usage. All patients should be observed closely for symptoms of depression or suicidal thoughts. Discontinuation of treatment alone may not be sufficient, further evaluation may be necessary. Use with extreme caution in patients with a history of psychiatric disorder.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; impaired glucose control has been reported.
- Hypertriglyceridemia: Use with caution in patients with hypertriglyceridemia; acute pancreatitis and fatal hemorrhagic pancreatitis (rare) have been reported; discontinue therapy if severe hypertriglyceridemia or symptoms of pancreatitis occurs.

Concurrent drug therapy issues:

- Tetracyclines: Pseudotumor cerebri (benign intracranial hypertension) has been reported with use of isotretinoin in combination with tetracyclines; concomitant use should be avoided.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Blood donation: Patients should be instructed not to donate blood during therapy and for 1 month following discontinuation of therapy due to risk of donated blood being given to a pregnant female.
- Experienced physician: This medication should only be prescribed by prescribers competent in treating severe recalcitrant nodular acne, are experienced in the use of systemic retinoids.
- Long-term use: Safety of long-term use is not established and is not recommended.
- Teratogenic effects/iPLEDGE™ program: **[U.S. Boxed Warning]: Because of the high likelihood of teratogenic effects, all patients (male and female), prescribers, wholesalers, and dispensing pharmacists must register and be active in the iPLEDGE™ risk management program; do not prescribe isotretinoin for women who are or who are likely to become pregnant while using the drug (see Additional Information or Pharmacotherapy Pearls for details).** Women of childbearing potential must be capable of complying with effective contraceptive measures. Patients must select and commit to two forms of contraception. Therapy is begun after two negative pregnancy tests; effective contraception must be used for at least 1 month before beginning therapy, during therapy, and for 1 month after discontinuation of therapy. Prescriptions should be written for no more than a 30-day supply, and pregnancy testing and counseling should be repeated monthly.

Pregnancy Risk FactorX

Pregnancy ConsiderationsMajor fetal abnormalities (both internal and external), spontaneous abortion, premature births and low IQ scores in surviving infants have been reported. [**U.S. Boxed Warning]: Because of the high likelihood of teratogenic effects, all patients (male and female), prescribers, wholesalers, and dispensing pharmacists must register and be active in the iPLEDGE™ risk management program; do not prescribe isotretinoin for women who are or who are likely to become pregnant while using the drug.** This medication is contraindicated in females of childbearing potential unless they are able to comply with the guidelines of the iPLEDGE™ pregnancy prevention program. Females of childbearing potential should not become pregnant during therapy or for 1 month following discontinuation of isotretinoin. Upon discontinuation of treatment, females of childbearing potential should have a pregnancy test after their last dose and again one month after their last dose. Two forms of contraception should be continued during this time. Any pregnancies should be reported to the iPLEDGE™ program (www.ipledgeprogram.com or 866-495-0654).

LactationExcretion in breast milk unknown/contraindicated

Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, tachycardia, vascular thrombotic disease, stroke, chest pain, syncope, flushing

Central nervous system: Edema, fatigue, pseudotumor cerebri, dizziness, drowsiness, headache, insomnia, lethargy, malaise, nervousness, paresthesia, seizure, stroke, suicidal ideation, suicide attempts, suicide, depression, psychosis, aggressive or violent behavior, emotional instability

Dermatologic: Cutaneous allergic reactions, purpura, acne fulminans, alopecia, bruising, cheilitis, dry mouth, dry nose, dry skin, epistaxis, eruptive xanthomas, fragility of skin, hair abnormalities, hirsutism, hyperpigmentation, hypopigmentation, peeling of palms, peeling of soles, photoallergic reactions, photosensitizing reactions, pruritus, rash, dystrophy, paronychia, facial erythema, seborrhea, eczema, increased sunburn susceptibility, urticaria, abnormal wound healing

Endocrine & metabolic: Triglycerides increased (25%), abnormal menses, blood glucose increased, cholesterol increased, HDL decreased

Gastrointestinal: Weight loss, inflammatory bowel disease, regional ileitis, pancreatitis, bleeding and inflammation of the gums, colitis, nausea, nonspecific gastrointestinal symptoms

Genitourinary: Nonspecific urogenital findings

Hematologic: Anemia, thrombocytopenia, neutropenia, agranulocytosis, pyogenic granuloma

Hepatic: Hepatitis

Neuromuscular & skeletal: Skeletal hyperostosis, calcification of tendons and ligaments, premature epiphyseal closure, arthralgia, CPK elevations, arthritis, tendonitis, bone abnormalities, weakness, back pain (29% in pediatric patients), rhabdomyolysis (rare), bone mineral density decreased

Ocular: Corneal opacities, decreased night vision, cataracts, color vision disorder, conjunctivitis, dry eyes, eyelid inflammation, keratitis, optic neuritis, photophobia, visual disturbances

Otic: Hearing impairment, tinnitus

Renal: Vasculitis, glomerulonephritis

Respiratory: Bronchospasms, respiratory infection, voice alteration, Wegener's granulomatosis

Miscellaneous: Allergic reactions, anaphylactic reactions, lymphadenopathy, infection, disseminated herpes simplex, diaphoresis

Drug Interactions

Oral Contraceptive (Estrogens): Retinoic Acid Derivatives may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): Retinoic Acid Derivatives may diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase triglyceride levels if taken in excess).

Food: Isotretinoin bioavailability increased if taken with food or milk.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization and may decrease the effectiveness of oral contraceptives). Additional vitamin A supplements may lead to vitamin A toxicity (dry skin, irritation, arthralgias, myalgias, abdominal pain, hepatic changes); avoid use.

Monitoring ParametersCBC with differential and platelet count, baseline sedimentation rate, glucose, CPK; signs of depression, mood alteration, psychosis, and agression

Pregnancy test (for all female patients of childbearing potential): Two negative tests with a sensitivity of at least 25 mIU/mL prior to beginning therapy (the second performed at least 19 days after the first test and performed during the first 5 days of the menstrual period immediately preceding the start of therapy); monthly tests to rule out pregnancy prior to refilling prescription.

Lipids: Prior to treatment and at weekly or biweekly intervals until response to treatment is established. Test should not be performed <36 hours after consumption of ethanol.

Liver function tests: Prior to treatment and at weekly or biweekly intervals until response to treatment is established.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and regularly with long-term use. Monitor patients with diabetes closely. Observe for depression or suicidal thoughts. Assess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Must have two negative pregnancy tests prior to beginning treatment. Do not give to women of childbearing age unless female is capable of complying with two contraceptive measures 1 month prior to therapy, during therapy, and 1 month following therapy.

Monitoring: Lab TestsCBC with differential and platelet count, baseline sedimentation rate, serum triglycerides, liver enzymes

Must have two negative pregnancy tests prior to beginning therapy (for all female patients of childbearing potential): Two negative tests with a sensitivity of at least 25 mIU/mL prior to beginning therapy (the second performed at least 19 days after the first test and performed during the first 5 days of the menstrual period immediately preceding the start of therapy); monthly tests to rule out pregnancy prior to refilling prescription.

Patient EducationA patient information/consent form must be signed before this medication is prescribed. Do not sign (and do not take this medication) if you do not understand all of the information on the form. Use exactly as directed; do not take more than recommended. Prescriptions will be written for a 1-month supply and must be filled within 7 days; they will not be honored if filled after that time or if they do not have the appropriate yellow qualification sticker attached. Capsule can be chewed and swallowed, swallowed, or opened with a large needle and contents sprinkled on applesauce or ice cream. Whole capsules should be swallowed with a full glass of liquid. Do not take any other vitamin A products, limit vitamin A intake, and increase exercise during therapy. Limit or avoid alcohol intake. Exacerbations of acne may occur during first weeks of therapy. You may experience headache, loss of night vision, muscle aches, lethargy, or visual disturbances (use caution when driving or engaging in tasks requiring alertness until response to drug is known); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); dry mouth or nausea (small frequent meals, sucking hard candy, or chewing gum may may help); or dryness, redness, or itching of skin, eye irritation, or increased sensitivity to contact lenses (wear regular glasses). Report depression or suicidal thoughts. Discontinue therapy and report acute vision changes, ringing in the ears or changes in hearing, rectal bleeding, abdominal cramping, or unresolved diarrhea. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Do not get pregnant 1 month before, during, or for 1 month following therapy. This drug may cause severe fetal defects. Two forms of contraception and monthly tests to rule out pregnancy are required during therapy. It is important to note that any type of contraception may fail, it is the responsibility of the patient to be compliant with contraceptive therapy. Do not donate blood during or for 1 month following therapy. Consult prescriber if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Accutane®: 10 mg, 20 mg, 40 mg [contains soybean oil and parabens]

Amnesteem™: 10 mg, 20 mg, 40 mg [contains soybean oil]

Claravis™: 10 mg, 20 mg, 40 mg

Sotret®: 10 mg, 20 mg, 30 mg, 40 mg [contains soybean oil]

Generic AvailableYes

ManufacturerRoche Laboratories Inc

Mechanism of ActionReduces sebaceous gland size and reduces sebum production; regulates cell proliferation and differentiation

Pharmacodynamics/Kinetics

Distribution: Crosses placenta

Protein binding: 99% to 100%; primarily albumin

Metabolism: Hepatic via CYP2B6, 2C8, 2C9, 2D6, 3A4; forms metabolites; major metabolite: 4-oxo-isotretinoin (active)

Half-life elimination: Terminal: Parent drug: 21 hours; Metabolite: 21-24 hours

Time to peak, serum: 3-5 hours

Excretion: Urine and feces (equal amounts)

Pharmacotherapy PearlsAll patients (male and female), must be registered in the iPLEDGE™ risk management program. Females of childbearing potential must receive oral and written information reviewing the hazards of therapy and the effects that isotretinoin can have on a fetus. Therapy should not begin without two negative pregnancy tests at least 19 days apart. Two forms of contraception (a primary and secondary form as described in the iPLEDGE™ program materials) must be used simultaneously beginning 1 month prior to treatment, during treatment, and for 1 month after therapy is discontinued; limitations to their use must be explained. Prescriptions should be written for no more than a 30-day supply, and pregnancy testing and counseling should be repeated monthly. During therapy, pregnancy tests must be conducted by a CLIA-certified laboratory. Prescriptions must be filled and picked up from the pharmacy within 7 days of specimen collection for pregnancy test for women of childbearing potential. Prescriptions for males and females of non-childbearing potential must be filled and picked up within 30 days of prescribing.

Any cases of accidental pregnancy should be reported to the iPLEDGE™ program or FDA MedWatch. All patients (male and female) must read and sign the informed consent material provided in the pregnancy prevention program.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, psychosis; may rarely cause suicidal ideation, suicide attempts, suicide, and aggressive and/or violent behaviors

Mental Health: Effects on Psychiatric TreatmentMay increase the clearance of carbamazepine, leading to decreased levels; monitor. Avoid dong quai and St John's wort (may cause photosensitization).

Isoxsuprine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Vasodilan® may be confused with Vasocidin®

Pronunciation(eye SOKS syoo preen)
U.S. Brand NamesVasodilan® [DSC]
Pharmacologic CategoryVasodilator
Use: Labeled IndicationsTreatment of peripheral vascular diseases, such as arteriosclerosis obliterans and Raynaud's disease
Dosing: AdultsPeripheral vascular disease: Oral: 10-20 mg 3-4 times/day; start with lower dose in elderly due to potential hypotension
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to isoxsuprine or any component of the formulation; presence of arterial bleeding; do not administer immediately postpartum
Geriatric ConsiderationsVasodilators have been used to treat dementia upon the premise that dementia is secondary to a cerebral blood flow insufficiency. The hypothesis is that if blood flow could be increased, cognitive function would be increased. This hypothesis is no longer valid. The use of vasodilators for cognitive dysfunction is not recommended or proven by appropriate scientific study.
Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, chest pain, tachycardia

Central nervous system: Dizziness

Dermatologic: Rash

Gastrointestinal: Nausea, vomiting

Neuromuscular & skeletal: Weakness

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 10 mg, 20 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Isoxsuprine HCl)

10 mg (90): $103.10

20 mg (90): $299.48

Tablets (Vasodilan)

20 mg (90): $59.99

Mechanism of ActionIn studies on normal human subjects, isoxsuprine increases muscle blood flow, but skin blood flow is usually unaffected. Rather than increasing muscle blood flow by beta-receptor stimulation, isoxsuprine probably has a direct action on vascular smooth muscle. The generally accepted mechanism of action of isoxsuprine on the uterus is beta-adrenergic stimulation. Isoxsuprine was shown to inhibit prostaglandin synthetase at high serum concentrations, with low concentrations there was an increase in the P-G synthesis.

Pharmacodynamics/Kinetics

Absorption: Nearly complete

Half-life elimination, serum: Mean: 1.25 hours

Time to peak, serum: ~1 hour

Dental Health: Effects on Dental TreatmentMay enhance effects of other vasodilators.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsSince isoxsuprine is frequently used in patients with significant peripheral vascular disease, these patients often have stenoses in the large coronary and cranial blood vessels. Hence, vasodilator effects which decrease perfusion pressure induce hypoperfusion magnified by the vascular stenotic lesions.

Index TermsIsoxsuprine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

> DynaCirc® may be confused with Dynabac®, Dynacin®

Pronunciation(iz RA di peen)
U.S. Brand NamesDynaCirc® CR
Canadian Brand NamesDynaCirc®
Pharmacologic CategoryCalcium Channel Blocker
Use: Labeled IndicationsTreatment of hypertension
Use: Unlabeled/InvestigationalPediatric hypertension
Dosing: AdultsHypertension: Oral:

Capsule: 2.5 mg twice daily; antihypertensive response occurs in 2-3 hours; maximal response in 2-4 weeks; increase dose at 2- to 4-week intervals at 2.5-5 mg increments; usual dose range (JNC 7): 2.5-10 mg/day in 2 divided doses. **Note:** Most patients show no improvement with doses >10 mg/day except adverse reaction rate increases; therefore, maximal dose in older adults should be 10 mg/day.

Controlled release tablet: 5 mg once daily; antihypertensive response occurs in 2 hours. Adjust dose in increments of 5 mg at 2-4 week intervals. Maximum dose 20 mg/day; adverse events are increased at doses >10 mg/day.

Dosing: Elderly

Capsule: Refer to adult dosing.

Controlled release tablet: Initial dose: 5 mg once daily

Dosing: Pediatric

Hypertension (unlabeled use): Capsule: Oral: Initial: 0.15-0.2 mg/kg/day in 2-3 divided doses; maximum 0.8 mg/kg/day, up to 20 mg/day. **Note:** Controlled release formulation is administered once daily or in 2 divided doses.

Dosing: Renal Impairment
Cl_{cr} 30-80 mL/minute: Bioavailability increased by 45%

Cl_{cr} <10 mL/minute on hemodialysis: Bioavailability decreased by 20% to 50%

Capsule: Refer to adult dosing.

Controlled release tablet: Initial dose: 5 mg once daily

Dosing: Hepatic Impairment

Peak serum concentrations are increased by 32% and bioavailability is increased by 52%.

Capsule: Refer to adult dosing.

Controlled release tablet: Initial dose: 5 mg once daily

Administration: OralControlled release tablets should be swallowed whole; do not divide or chew
Dietary ConsiderationsMay be taken without regard to meals.
Extemporaneously PreparedA 1 mg/mL oral liquid was stable for 35 days when refrigerated when compounded as follows:

Dissolve the contents of ten 5 mg capsules in simple syrup, qs ad 50 mL

Shake well before using and keep in refrigerator

> MacDonald JL, Johnson CE, and Jacobson P, “Stability of Isradipine in Extemporaneously Compounded Oral Liquids,” *Am J Hosp Pharm*, 1994, 51(19):2409-11.

ContraindicationsHypersensitivity to isradipine or any component of the formulation; hypotension (<90 mm Hg systolic)
Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition.

- Peripheral edema: The most common side effect is peripheral edema; occurs within 2-3 weeks of starting therapy.

- Reflex tachycardia: May occur with use.

Disease-related concerns:

- Heart failure (HF): Use with caution in patients with HF.

- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.

- Idiopathic hypertrophic subaortic stenosis (IHSS): Use with caution in patients with IHSS.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Controlled release tablets: Use controlled release tablets with caution in patients with severe GI narrowing.

Other warnings/precautions:

- Titration: Adjust doses at 2- to 4-week intervals.

Geriatric ConsiderationsElderly may experience a greater hypotensive response. Constipation may be more of a problem in the elderly. Calcium channel blockers are no more effective in the elderly than other therapies; however, they do not cause significant CNS effects which is an advantage over some antihypertensive agents.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Israpidine crosses the human placenta. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsPercentages reported with capsule formulation.

>10%: Central nervous system: Headache (dose related 2% to 22%)

1% to 10%:

Cardiovascular: Edema (dose related 1% to 9%), palpitation (dose related 1% to 5%), flushing (dose related 1% to 5%), tachycardia (1% to 3%), chest pain (2% to 3%)

Central nervous system: Dizziness (2% to 8%), fatigue (dose related 1% to 9%)

Dermatologic: Rash (2%)

Gastrointestinal: Nausea (1% to 5%), abdominal discomfort (≤3%), vomiting (≤1%), diarrhea (≤3%)

Neuromuscular & skeletal: Weakness (≤1%)

Renal: Urinary frequency (1% to 3%)

Respiratory: Dyspnea (1% to 3%)

<1%: Angioedema, atrial fibrillation, back pain, constipation, cough, cramps of legs and feet, depression, drowsiness, drug fever, dry mouth, dysuria, epistaxis, gingival hyperplasia (incidence unknown), heart failure, hyperhidrosis, hypotension, impotence, insomnia, joint pain, leg pain, lethargy, leukopenia, libido decreased, liver function tests increased, MI, nasal congestion, nervousness, nocturia, numbness, paresthesia,pruritus, stroke, syncope, throat discomfort,transient ischemic attack, urticaria, ventricular fibrillation, visual disturbance, weight gain

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)

Drug Interactions

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Administration with food delays absorption, but does not affect availability

Herb/Nutraceutical: St John's wort may decrease isradipine levels. Avoid dong quai if using for hypertension. Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), gotu kola, licorice (may worsen hypertension) Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure; renal, hepatic dysfunction

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, potential to increase or decrease levels/effects of isradipine). Assess therapeutic effectiveness (normotensive) and adverse response (eg, tachycardia, hypotension, edema, dyspnea) at regular intervals during therapy. When discontinuing, taper dose slowly. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as prescribed, with or without food. Do not stop abruptly without consulting prescriber. Do not crush extended release tablets. This medication does not replace other antihypertensive interventions; follow prescriber's instructions for diet and lifestyle changes. You may experience headache (if unrelieved, consult prescriber for approved analgesic); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased dietary bulk and fluids may help); or dizziness, fatigue, confusion (use caution when driving or engaging in potentially hazardous tasks until response to drug is known). Report unrelieved headache, vomiting, or constipation; chest pain, palpitations, or rapid heartbeat; swelling of hands or feet or sudden weight gain (>5 lb/week); or unusual cramps in legs or feet. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 2.5 mg, 5 mg

Tablet, controlled release:

DynaCirc® CR: 5 mg, 10 mg

Generic AvailableYes: Capsule

Pricing: U.S. (www.drugstore.com)

Capsules (DynaCirc)

2.5 mg (60): $79.99

5 mg (60): $129.19

Capsules (Isradipine)

2.5 mg (60): $65.99

Tablet, 24-hour (DynaCirc CR)

5 mg (30): $79.99

10 mg (30): $159.73

Mechanism of ActionInhibits calcium ion from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina

Pharmacodynamics/Kinetics

Onset of action: Immediate release: 2-3 hours

Duration: Immediate release: >12 hours

Absorption: 90% to 95%

Distribution: V_d: 3 L/kg

Protein binding: 95%

Metabolism: Hepatic; CYP3A4 substrate (major); extensive first-pass effect; forms metabolites (inactive)

Bioavailability: 15% to 24%

Half-life elimination: Terminal: 8 hours

Time to peak, serum: 1-1.5 hours

Excretion: Urine (60% to 65% as metabolites); feces (25% to 30%)

Related Information

- Calcium Channel Blockers

Dental Health: Effects on Dental TreatmentUnlike other calcium channel blockers, information is sparse as to whether isradipine causes gingival hyperplasia. Consultation with physician is suggested if hyperplasia is observed in patients taking isradipine.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsIsradipine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsIsradipine alone or in combination with other agents is effective in the management of hypertension.

In the treatment of unstable angina/non-ST-segment elevation MI, a nondihydropyridine calcium antagonist (diltiazem or verapamil) may be considered in patients with continuing or frequently recurring ischemia when beta-blockers are contraindicated (Class I). Oral long-acting calcium antagonists may also be considered in addition to beta-blockers and nitrates (Class IIa).

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Sporanox® may be confused with Suprax®

Pronunciation(i tra KOE na zole)

U.S. Brand NamesSporanox®

Canadian Brand NamesSporanox®

Pharmacologic CategoryAntifungal Agent, Oral

Use: Labeled IndicationsTreatment of susceptible fungal infections in immunocompromised and immunocompetent patients including blastomycosis and histoplasmosis; indicated for aspergillosis, and onychomycosis of the toenail; treatment of onychomycosis of the fingernail without concomitant toenail infection via a pulse-type dosing regimen; has activity against *Aspergillus*, *Candida*, *Coccidioides*, *Cryptococcus*, *Sporothrix*, tinea unguium

Oral: Useful in superficial mycoses including dermatophytoses (eg, tinea capitis), pityriasis versicolor, sebopsoriasis, vaginal and chronic mucocutaneous candidiases; systemic mycoses including candidiasis, meningeal and disseminated cryptococcal infections, paracoccidioidomycosis, coccidioidomycoses; miscellaneous mycoses such as sporotrichosis, chromomycosis, leishmaniasis, fungal keratitis, alternariosis, zygomycosis

Oral solution: Treatment of oral and esophageal candidiasis

Intravenous solution: Indicated in the treatment of blastomycosis, histoplasmosis (nonmeningeal), and aspergillosis (in patients intolerant or refractory to amphotericin B therapy); empiric therapy of febrile neutropenic fever

Use: DentalTreatment of susceptible fungal infections in immunocompromised and immunocompetent patients including blastomycosis and histoplasmosis; has activity against *Aspergillus, Candida, Coccidioides, Cryptococcus, Sporothrix,* and chromomycosis. Useful in superficial mycoses including dermatophytoses (eg, tinea capitis), pityriasis versicolor, sebopsoriasis, vaginal and chronic mucocutaneous candidiases; systemic mycoses including candidiasis, meningeal and disseminated cryptococcal infections, paracoccidioidomycosis, coccidioidomycoses; miscellaneous mycoses such as sporotrichosis, chromomycosis, leishmaniasis, fungal keratitis, alternariosis, zygomycosis.

Dosing: Adults

Aspergillosis, invasive (salvage therapy): Duration of therapy should be a minimum of 6-12 weeks or throughout period of immunosuppression:

Oral: 200-400 mg/day; **Note:** 2008 IDSA guidelines recommend 600 mg/day for 3 days, followed by 400 mg/day

I.V.: 200 mg twice daily for 4 doses, followed by 200 mg daily

Appropriate use: Itraconazole should **NOT** be used for voriconazole-refractory aspergillosis since the same antifungal and/or resistance mechanism(s) may be shared by both agents. Itraconazole oral solution and capsule formulations are not bioequivalent or interchangeable. Due to variable bioavailability of oral preparations, therapeutic drug monitoring advisable.

Aspergillosis, allergic (ABPA, sinusitis): Oral: 200 mg/day; may be used in conjunction with corticosteroids

Blastomycosis/histoplasmosis:

Oral: 200 mg once daily, if no obvious improvement or there is evidence of progressive fungal disease, increase the dose in 100 mg increments to a maximum of 400 mg/day. Doses >200 mg/day are given in 2 divided doses. Length of therapy varies from 1 day to >6 months depending on the condition and mycological response.

I.V.: 200 mg twice daily for 4 doses, followed by 200 mg daily

Brain abscess: Cerebral phaeohyphomycosis (dematiaceous): Oral: 200 mg twice daily for at least 6 months with amphotericin

Candidiasis:

Oropharyngeal: Oral (solution): 200 mg once daily for 1-2 weeks; in patients unresponsive or refractory to fluconazole: 100 mg twice daily (clinical response expected in 1-2 weeks)

Esophageal: Oral (solution): 100-200 mg once daily for a minimum of 3 weeks; continue dosing for 2 weeks after resolution of symptoms

Coccidioides: Oral: 200 mg twice daily

Infections, Life-threatening:

Oral: Loading dose: 200 mg 3 times/day (600 mg/day) should be given for the first 3 days of therapy.

I.V.: 200 mg twice daily for 4 doses, followed by 200 mg/day

Meningitis: Oral:

Coccidioides: 400-800 mg/day

Cryptococcal: HIV positive (unlabeled use): Induction: 400 mg/day for 10-12 weeks; maintenance: 200 mg twice daily lifelong

Onychomycosis: Oral: 200 mg once daily for 12 consecutive weeks; alternative “pulse-dosing” may be considering for fingernail involvement only: 200 mg twice daily for 1 week; repeat 1-week course after 3 week off-time

Pneumonia:

Coccidioides: Mild to moderate: Oral, I.V.: 200 mg twice daily

Cryptococcal: Mild to moderate (unlabeled use): 200-400 mg/day for 6-12 months (lifelong for HIV positive)

Protothecal infection: 200 mg once daily for 2 months

Sporotrichosis: Oral:

Lymphocutaneous: 100-200 mg/day for 3-6 months

Osteoarticular and pulmonary: 200 mg twice daily for 1-2 years (may use amphotericin B initially for stabilization)

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricEfficacy and safety have not been established; a small number of patients 3-16 years of age have been treated with 100 mg/day for systemic fungal infections with no serious adverse effects reported. A dose of 5 mg/kg once daily was used in a pharmacokinetic study using the oral solution in patients 6 months-12 years; duration of study was 2 weeks.
Dosing: Renal ImpairmentNot necessary. Itraconazole injection is not recommended in patients with a creatinine clearance <30 mL/minute; hydroxypropyl-β-cyclodextrin (the excipient) is eliminated primarily by the kidneys.

Not dialyzable

Dosing: Hepatic ImpairmentMay be necessary, but specific guidelines are not available. Risk-to-benefit evaluation should be undertaken in patients who develop liver function abnormalities during treatment.
Administration: I.V.Infuse 60 mL of the dilute solution (3.33 mg/mL = 200 mg itraconazole, pH ~4.8) over 60 minutes; flush with 15-20 mL of 0.9% sodium chloride over 30 seconds to 15 minutes
Administration: OralDoses >200 mg/day are given in 2 divided doses; do not administer with antacids. Capsule and oral solution formulations are not bioequivalent and thus are not interchangeable. Capsule absorption is best if taken with food, therefore, it is best to administer itraconazole after meals; solution should be taken on an empty stomach. When treating oropharyngeal and esophageal candidiasis, solution should be swished vigorously in mouth, then swallowed.
Dietary Considerations

Capsule: Administer with food.

Solution: Take without food, if possible.

Storage

Capsule: Store at room temperature, 15°C to 25°C (59°F to 77°F). Protect from light and moisture.

Oral solution: Store at ≤25°C (77°F); do not freeze.

Solution for injection: Store at ≤25°C (77°F); do not freeze. Protect from light. Stable for 48 hours at room temperature or under refrigeration.

ReconstitutionDilute solution for injection with 0.9% sodium chloride. A precise mixing ratio is required to maintain stability (3.33:1) and avoid precipitate formation. Add 25 mL (1 ampul) to 50 mL 0.9% sodium chloride. Mix and withdraw 15 mL of solution before infusing.
CompatibilityStable in NS.
ContraindicationsHypersensitivity to itraconazole, any component of the formulation, or to other azoles; concurrent administration with cisapride, dofetilide, ergot derivatives, levomethadyl, lovastatin, midazolam, pimozide, quinidine, simvastatin, or triazolam; treatment of onychomycosis in patients with evidence of left ventricular dysfunction, CHF, or a history of CHF
Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Boxed warnings:

• High potential for interactions: See “Concurrent drug therapy issues” below.

• Onychomycosis: See “Disease-related concerns” below.

Concerns related to adverse effects:

• Heart failure (HF): Discontinue if signs or symptoms of HF occurs during treatment.

• Neuropathy: Discontinue if signs or symptoms of neuropathy occurs during treatment.

Disease-related concerns:

- Cystic fibrosis: Large differences in itraconazole pharmacokinetic parameters have been observed in cystic fibrosis patients receiving the solution; if a patient with cystic fibrosis does not respond to therapy, alternate therapies should be considered.

- Hepatic impairment: Serious (and rarely fatal) hepatic toxicity (eg, hepatitis, cholestasis, fulminant failure) has been observed with azole therapy. Use with caution in patients with pre-existing hepatic impairment; monitor liver function closely and dosage adjustment may be warranted. Not recommended for use in patients with active liver disease, elevated liver enzymes, or prior hepatotoxic reactions to other drugs.

- Onychomycosis: **[U.S. Boxed Warning]: Not recommended for treatment of onychomycosis in patients with left ventricular dysfunction or a history of CHF.**

Concurrent drug therapy issues:

- High potential for interactions: **[U.S. Boxed Warning]: Rare cases of serious cardiovascular adverse events (including death), ventricular tachycardia, and torsade de pointes have been observed due to increased cisapride, pimozide, quinidine, dofetilide or levomethadyl concentrations induced by itraconazole; concurrent use contraindicated.**

Dosage form specific issues:

- Injectable: Intravenous formulation should be used with caution in renal impairment; consider conversion to oral therapy if renal dysfunction/toxicity is noted.

- Oral solution: Initiation of treatment with oral solution is not recommended in patients at immediate risk for systemic candidiasis (eg, patients with severe neutropenia).

- Product interchangeability: Due to differences in bioavailability, oral capsules and oral solution **cannot be used interchangeably.**

Geriatric ConsiderationsNo specific data for the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsShould not be used to treat onychomycosis during pregnancy. Effective contraception should be used during treatment and for 2 months following treatment. Congenital abnormalities have been reported during postmarketing surveillance, but a causal relationship has not been established.
LactationEnters breast milk/not recommended
Adverse ReactionsListed incidences are for higher doses appropriate for systemic fungal infection.

>10%: Gastrointestinal: Nausea (11%)

1% to 10%:

Cardiovascular: Edema (4%), hypertension (3%)

Central nervous system: Headache (4%), fatigue (2% to 3%), malaise (1%), fever (3%), dizziness (2%)

Dermatologic: Rash (9%), pruritus (3%)

Endocrine & metabolic: Decreased libido (1%), hypertriglyceridemia, hypokalemia (2%)

Gastrointestinal: Abdominal pain (2%), anorexia (1%), vomiting (5%), diarrhea (3%)

Hepatic: Abnormal LFTs (3%), hepatitis

Renal: Albuminuria (1%)

<1%: Adrenal suppression, constipation, gastritis, gynecomastia, impotence, somnolence, tinnitus

Postmarketing and/or case reports: Allergic reactions (urticaria, angioedema); alopecia, anaphylactoid reactions, anaphylaxis, arrhythmia, CHF, hepatic failure, menstrual disorders, neutropenia, peripheral neuropathy, photosensitivity, pulmonary edema, Stevens-Johnson syndrome

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (strong)
Drug Interactions

Alfentanil: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amphotericin B: Antifungal Agents (Azole Derivatives, Systemic) may diminish the therapeutic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Aprepitant: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Aprepitant. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Quazepam. *Risk D: Consider therapy modification*

Bosentan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Bosentan. *Risk C: Monitor therapy*

BusPIRone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Busulfan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Busulfan. *Risk C: Monitor therapy*

Calcium Channel Blockers: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Cardiac Glycosides: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Cisapride: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Conivaptan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Conivaptan. *Risk X: Avoid combination*

Corticosteroids (Orally Inhaled): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). Enteric coated didanosine capsules are not expected to affect these antifungals. *Risk D: Consider therapy modification*

Docetaxel: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Docetaxel. *Risk D: Consider therapy modification*

Dofetilide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Dofetilide. *Risk X: Avoid combination*

Efavirenz: May decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Eletriptan: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eplerenone. *Risk D: Consider therapy modification*

Erlotinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Erlotinib. *Risk C: Monitor therapy*

Eszopiclone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eszopiclone. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fosaprepitant: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Fosaprepitant. Specifically, concentrations of aprepitant are likely to be increased. *Risk C: Monitor therapy*

Gefitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Gefitinib. *Risk C: Monitor therapy*

Grapefruit Juice: May increase the metabolism of Antifungal Agents (Azole Derivatives, Systemic). This specifically applies to oral antifungal administration. *Risk D: Consider therapy modification*

H2-Antagonists: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Imatinib. *Risk C: Monitor therapy*

Irinotecan: Antifungal Agents (Azole Derivatives, Systemic) may enhance the adverse/toxic effect of Irinotecan. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Losartan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Methadone. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Paliperidone: Itraconazole may decrease the metabolism of Paliperidone. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Phenytoin. Phenytoin may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

QuiNIDine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of QuiNIDine. Management: Itraconazole, voriconazole, and posaconazole are specifically contraindicated with quinidine. Use of quinidine with any azole antifungal may require quinidine dose adjustment and should be done with caution and close monitoring. *Risk X: Avoid combination*

Ramelteon: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Rifamycin Derivatives: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Sirolimus. Management: Sirolimus dose reductions of up to 50-90% may be necessary when starting an azole antifungal. Use of sirolimus with the azole antifungals voriconazole and posaconazole is contraindicated. *Risk D: Consider therapy modification*

Solifenacin: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Solifenacin. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Sucralfate: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk C: Monitor therapy*

Sunitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are likely to be increased more substantially than those of the parent temsirolimus. *Risk D: Consider therapy modification*

Tolterodine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk D: Consider therapy modification*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

VinBLAStine: Itraconazole may increase the serum concentration of VinBLAStine. *Risk C: Monitor therapy*

VinCRIStine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of VinCRIStine. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Itraconazole may increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Zolpidem: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Zolpidem. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food:

Capsules: Enhanced by food and possibly by gastric acidity. Cola drinks have been shown to increase the absorption of the capsules in patients with achlorhydria or those taking H_2-receptor antagonists or other gastric acid suppressors. Avoid grapefruit juice.

Solution: Decreased by food, time to peak concentration prolonged by food.

Herb/Nutraceutical: St John's wort may decrease itraconazole levels.

Monitoring ParametersLiver function in patients with pre-existing hepatic dysfunction, and in all patients being treated for longer than 1 month; serum (trough) concentrations particularly for oral therapy (due to erratic bioavailability with capsule formulation)

Reference RangeTrough serum concentrations may be performed to assure therapeutic levels, especially in the face of oral therapy. Trough concentration of itraconzole plus the metabolite hydroxyitraconazole should be at least 0.5 mcg/mL.

Nursing: Physical Assessment/MonitoringEvaluate hepatic status carefully prior to treatment. Assess potential for interactions with other pharmacological or herbal products patient may be taking (eg, anything that reduces gastric acidity may result in treatment failure of itraconazole). See Administration for capsule, oral solution, and infusion specifics (eg, oral capsules and oral solution cannot be used interchangeably). Assess results of laboratory tests (LFTs), therapeutic effectiveness (resolution of fungal infection), and adverse reactions at regular intervals during therapy. Teach patient proper use (eg, necessity of taking full course of therapy), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsLiver function in patients with pre-existing hepatic dysfunction, and in all patients being treated for longer than 1 monthmonth; serum (trough) concentrations particularly for oral therapy (due to erratic bioavailability with capsule formulation)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Use exactly as directed. Take full course of medication even if infections appears to be resolved, do not discontinue without consulting prescriber (treatment for some fungal infections may take several weeks or months). Take capsule immediately after meals; take solution on empty stomach, 1 hour before or 2 hours after meals. Do not take antacids of other medications within 1 hour before or 2 hours after itraconazole. Avoid grapefruit juice while taking this medication. Observe good hygiene measures to prevent reinfection. If you have diabetes, test serum glucose regularly (may affect response to oral hypoglycemics). Frequent blood tests may be required with prolonged therapy. May cause dizziness or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea, vomiting, or anorexia (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Stop therapy and report immediately any signs and symptoms that may suggest liver dysfunction (eg, unusual fatigue, anorexia, nausea and/or vomiting, jaundice [yellowing of skin or sclera], dark urine, or pale stool) so that the appropriate laboratory testing can be done. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber about appropriate contraceptive use, efficacy of oral contraceptives may be reduced. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule: 100 mg

Sporanox®: 100 mg

Injection, solution:

Sporanox®: 10 mg/mL (25 mL) [packaged in a kit containing sodium chloride 0.9% (50 mL); filtered infusion set (1)] [DSC]

Solution, oral:

Sporanox®: 100 mg/10 mL (150 mL) [cherry flavor]

Generic AvailableYes: Capsule

ManufacturerJanssen Pharmaceutica Products, LP

Pricing: U.S. (www.drugstore.com)

Capsules (Itraconazole)

100 mg (28): $239.97

100 mg (30): $239.99

Capsules (Sporanox)

100 mg (30): $353.13

Capsules (Sporanox Pulsepak)

100 mg (28): $330.88

Solution (Sporanox)

10 mg/mL (150): $173.85

Mechanism of ActionInterferes with cytochrome P450 activity, decreasing ergosterol synthesis (principal sterol in fungal cell membrane) and inhibiting cell membrane formation

Pharmacodynamics/Kinetics

Absorption: Requires gastric acidity; capsule better absorbed with food, solution better absorbed on empty stomach

Distribution: V_d (average): 796 ± 185 L or 10 L/kg; highly lipophilic and tissue concentrations are higher than plasma concentrations. The highest concentrations: adipose, omentum, endometrium, cervical and vaginal mucus, and skin/nails. Aqueous fluids (eg, CSF and urine) contain negligible amounts.

Protein binding, plasma: 99.9%; metabolite hydroxy-itraconazole: 99.5%

Metabolism: Extensively hepatic via CYP3A4 into >30 metabolites including hydroxy-itraconazole (major metabolite); appears to have *in vitro* antifungal activity. Main metabolic pathway is oxidation; may undergo saturation metabolism with multiple dosing.

Bioavailability: Variable, ~55% (oral solution) in 1 small study; **Note:** Oral solution has a higher degree of bioavailability (149% ± 68%) relative to oral capsules; should not be interchanged

Half-life elimination: Oral: After single 200 mg dose: 21 ± 5 hours; 64 hours at steady-state; I.V.: steady-state: 35 hours; steady-state concentrations are achieved in 13 days with multiple administration of itraconazole 100-400 mg/day.

Excretion: Feces (~3% to 18%); urine (~0.03% as parent drug, 40% as metabolites)

Related Information

- Antifungal Agents
- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsDue to potential toxicity, the manufacturer recommends confirmation of diagnosis testing of nail specimens prior to treatment of onychomycosis.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentContraindicated with oral midazolam, pimozide, and triazolam

Cardiovascular ConsiderationsItraconazole has negative inotropic properties and cases of new heart failure or exacerbation of congestive heart failure have been reported. Itraconazole is contraindicated for the treatment of onychomycosis in patients with heart failure. The benefit:risk for therapy in the treatment of other types of fungal infections should be carefully considered in each patient, particularly those with congestive heart failure and in heart transplant recipients. If indicated after cardiac, renal, or liver transplantation, itraconazole can increase cyclosporine levels by up to 50% at high doses. It also increases serum levels of lovastatin by up to 20-fold, as well as other HMG-CoA reductase inhibitors, by inhibiting CYP3A4. This is important since many post-transplantation patients are also hyperlipidemic and on HMG-CoA reductase inhibitors. Itraconazole may also increase levels of dofetilide and quinidine. The simultaneous administration of these medications is contraindicated because of increased risk of cardiotoxicity.

Ivermectin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(eye ver MEK tin)
U.S. Brand NamesStromectol®
Pharmacologic CategoryAnthelmintic
Use: Labeled IndicationsTreatment of the following infections: Strongyloidiasis of the intestinal tract due to the nematode parasite *Strongyloides stercoralis*. Onchocerciasis due to the nematode parasite *Onchocerca volvulus*. Ivermectin is only active against the immature form of *Onchocerca volvulus*, and the intestinal forms of *Strongyloides stercoralis*.
Use: Unlabeled/InvestigationalHas been used for other parasitic infections including *Ascaris lumbricoides*, Bancroftian filariasis, *Brugia malayi*, scabies, *Enterobius vermicularis*, *Mansonella ozzardi*, *Gnathostomia spingerum*, *Mansonella ozzardi*, *Mansonella streptocera*, pediculosis pubis, *Trichuris trichiura*.
Dosing: Adults

Onchocerciasis: Oral: 150 mcg/kg as a single dose; retreatment may be required every 3-12 months until the adult worms die

Weight-based dosage to provide ~150 mcg/kg:

15-25 kg: 3 mg

26-44 kg: 6 mg

45-64 kg: 9 mg

65-84 kg: 12 mg

≥85 kg: 150 mcg/kg

Strongyloidiasis: Oral: 200 mcg/kg as a single dose; perform follow-up stool examinations; CDC recommendations: 200 mcg/kg/day for 2 days

Weight-based dosage to provide ~200 mcg/kg:

15-24 kg: 3 mg

25-35 kg: 6 mg

36-50 kg: 9 mg

51-65 kg: 12 mg

66-79 kg: 15 mg

≥80 kg: 200 mcg/kg

Ascariasis due to*Ascaris lumbricoides*(unlabeled use): Oral: CDC recommendation: 150-200 mcg/kg as a single dose

Filariasis due to*Mansonella ozzardi*(unlabeled use): Oral: CDC recommendation: 200 mcg/kg as a single dose

Filariasis due to*Mansonella streptocera*(unlabeled use): Oral: CDC recommendation: 150 mcg/kg as a single dose

Gnathostomiasis due to*Gnathostomia spingerum*(unlabeled use): Oral: CDC recommendation: 200 mcg/kg/day for 2 days

Scabies due to *Sarcoptes scabiei*(unlabeled use): Oral: CDC recommendation: 200 mcg/kg as a single dose; repeat in 2 weeks

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricParasitic infections: Oral: Children ≥15 kg: Refer to adult dosing.
Administration: OralAdminister on an empty stomach with water.
Dietary ConsiderationsTake on an empty stomach with water.
StorageStore at <30°C (86°F).
ContraindicationsHypersensitivity to ivermectin or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Cutaneous/systemic reactions: Data have shown that antihelmintic drugs like ivermectin may cause cutaneous and/or systemic reactions (Mazzoti reaction) of varying severity including ophthalmological reactions in patients with onchocerciasis. These reactions are probably due to allergic and inflammatory responses to the death of microfilariae. Patients with hyper-reactive onchodermatitis may be more likely than others to experience severe adverse reactions, especially edema and aggravation of the onchodermatitis.

Disease-related concerns:

- Loiasis: Pretreatment assessment for *Loa loa* infection is recommended in any patient with significant exposure to endemic areas (West and Central Africa); serious and/or fatal encephalopathy has been reported (rarely) during treatment in patients with loiasis.

Special populations:

- Immunocompromised patients: Repeated treatment may be required in immunocompromised patients (eg, HIV); control of extraintestinal strongyloidiasis may necessitate suppressive (once monthly) therapy.

- Pediatrics: Safety and efficacy have not be established in children <15 kg.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects have been observed in animal studies. Safety has not been established in pregnant women. The manufacturer and the Centers for Disease Control and Prevention (CDC) do not recommend use in pregnant women.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSafety and efficacy for use in children <15 kg have not been established in the U.S.; therefore, ivermectin use is not recommended during lactation.

Adverse Reactions

>10%: Miscellaneous: Mazzotti-type reaction (with onchocerciasis): Pruritus (28%), fever (23%), skin involvement (including edema/urticarial rash [23%]), lymph node tenderness (1% to 14%), lymph node enlargement (3% to 13%), arthralgia/synovitis (9%)

1% to 10%:

Cardiovascular: Tachycardia (4%), peripheral edema (3%), facial edema (1%), orthostatic hypotension (1%)

Central nervous system: Dizziness (3%)

Dermatologic: Pruritus (3%)

Gastrointestinal: Diarrhea (2%), nausea (2%)

Hematologic: Eosinophilia (3%), leukocytes decreased (3%), hemoglobin increased (1%)

Hepatic: ALT increased (2%), AST increased (2%)

Ocular: Limbitis (4% to 6%), punctuate opacity (1% to 2%)

<1%, postmarketing, and/or case reports: Abdominal pain, anemia, anorexia, anterior uveitis, asthma exacerbation, back pain, bilirubin increased, chest discomfort, chorioretinitis, choroiditis, coma, confusion, conjunctival hemorrhage, conjunctivitis, constipation, dyspnea, encephalopathy (rare; associated with loiasis), eyelid edema, eye sensation abnormal, fatigue, fecal incontinence, headache, hypotension, INR increased, keratitis, lethargy, leukopenia, mental status changes, myalgia, neck pain, rash, red eye, seizure, somnolence, standing/walking difficulty, Stevens-Johnson syndrome, stupor, toxic epidermal necrolysis, tremor, urinary incontinence, urticaria, vertigo, vision loss (transient), weakness, vomiting

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Ivermectin may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Bioavailability is increased 2.5-fold when administered following a high-fat meal.

Monitoring ParametersSkin and eye microfilarial counts, periodic ophthalmologic exams; follow up stool examinations

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet [scored]:

Stromectol®: 3 mg

Generic AvailableNo

ManufacturerMerck & Co

Pricing: U.S. (www.drugstore.com)

Tablets (Stromectol)

3 mg (20): $103.99

Mechanism of ActionIvermectin is a semisynthetic antihelminthic agent; it binds selectively and with strong affinity to glutamate-gated chloride ion channels which occur in invertebrate nerve and muscle cells. This leads to increased permeability of cell membranes to chloride ions then hyperpolarization of the nerve or muscle cell, and death of the parasite.

Pharmacodynamics/Kinetics

Onset of action: Peak effect in treatment of onchocerciasis: 3-6 months

Absorption: Well absorbed

Distribution: Does not cross blood-brain barrier

Half-life elimination: ~18 hours

Metabolism: Hepatic (>97%)

Bioavailability: Increased with high-fat meal

Time to peak, serum: ~4 hours

Excretion: Feces; urine (<1%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, or insomnia

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ix ab EP i lone)

U.S. Brand NamesIxempra™

Pharmacologic CategoryAntineoplastic Agent, Antimicrotubular; Antineoplastic Agent, Epothilone B Analog

Use: Labeled IndicationsTreatment of metastatic or locally-advanced breast cancer (refractory or resistant)

Dosing: AdultsMetastatic or locally-advanced breast cancer: 40 mg/m^2 every 3 weeks (maximum dose: 88 mg)

Note: Premedicate with an oral H_1-antagonist (eg, diphenhydramine 50 mg) and an oral H_2-antagonist (eg, ranitidine 150-300 mg) 1 hour prior to infusion. Patients with a history of hypersensitivity should also be premedicated with corticosteroids (orally 1 hour before or I.V. 30 minutes before infusion). Body surface area (BSA) is capped at a maximum of 2.2 m^2.

Dosage adjustment with concurrent strong CYP3A4 inhibitor: If concurrent use can not be avoided, reduce ixabepilone dose to 20 mg/m^2. When a strong CYP3A4 inhibitor is discontinued, allow ~1 week to elapse prior to adjusting ixabepilone dose upward.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentPharmacokinetics (monotherapy) are not affected in patients with mild-to-moderate renal insufficiency (Cl_{cr} >30 mL/minute); monotherapy has not been studied in patients with serum creatinine >1.5 times ULN. Combination therapy with capecitabine has not been studied in patients with Cl_{cr} <50 mL/minute.

Dosing: Hepatic Impairment

Ixabepilone monotherapy (initial cycle; adjust doses for subsequent cycles based on toxicity):

AST and ALT ≤2.5 times ULN and bilirubin ≤1 times ULN: No adjustment necessary

AST or ALT ≤10 times ULN and bilirubin ≤1.5 times ULN: Reduce dose to 32 mg/m^2

AST and ALT ≤10 times ULN and bilirubin >1.5 - ≤3 times ULN: Reduce dose to 20-30 mg/m^2

AST or ALT >10 times ULN or bilirubin >3 times ULN: Use is not recommended

Combination therapy of ixabepilone with capecitabine:

AST and ALT ≤2.5 times ULN and bilirubin ≤1 times ULN: No adjustment necessary

AST or ALT >2.5 times ULN or bilirubin >1 times ULN: Use is contraindicated

Dosing: Adjustment for Toxicity

Hematologic:

Neutrophils <500/mm^3 for ≥7 days: Reduce dose by 20%

Neutropenic fever: Reduce dose by 20%

Platelets <25,000/mm^3 (or <50,000/mm^3 with bleeding): Reduce dose by 20%

Nonhematologic:

Neuropathy:

- Grade 2 (moderate) for ≥7 days: Reduce dose by 20%
- Grade 3 (severe) for <7days: Reduce dose by 20%
- Grade 3 (severe or disabling) for ≥7 days: Discontinue treatment

Grade 3 toxicity (severe; other than neuropathy): Reduce dose by 20%

Grade 3 arthralgia/myalgia or fatigue (transient): Continue at current dose

Grade 3 hand-foot syndrome: Continue at current dose

Grade 4 toxicity (disabling): Discontinue treatment

Note: Adjust dosage at the start of a cycle are based on toxicities (hematologic and nonhematologic) from the previous cycle; delay new cycles until neutrophils have recovered to >1500/mm^3, platelets have recovered to >100,000/mm^3 and nonhematologic toxicities have resolved to at least grade 1. If toxicities persist despite initial dose reduction, reduce dose an additional 20%.

Capecitabine dosage adjustments for combination therapy with ixabepilone:

Hematologic:

Neutrophils <500/mm^3 for ≥7 days or neutropenic fever: Hold for concurrent diarrhea or stomatitis until neutrophils recover to >1000/mm3, then continue at same dose

Platelets <25,000/mm^3 (or <50,000/mm^3 with bleeding): Hold for concurrent diarrhea or stomatitis until platelets recover to >50,000/mm^3, then continue at same dose

Nonhematologic: Refer to Capecitabine monograph.

Dosing: Combination Regimens

Breast cancer: Ixabepilone-Capecitabine

Calculations

- Body Surface Area: Adults

Administration: I.V.Infuse over 3 hours.

Administration: I.V. DetailUse non-DEHP administration set (eg, polyethylene); filter with a 0.2-1.2 micron inline filter.

Dietary ConsiderationsAvoid grapefruit juice.

StorageStore intact vials under refrigeration at 2°C to 8°C (36°F to 46°F); protect from light. Reconstituted solution (in the vial) is stable for 1 hour at room temperature; infusion solution diluted in lactated Ringer's is stable for 6 hours at room temperature.

ReconstitutionAllow to reach room temperature for ~30 minutes prior to reconstitution. Diluent vial may contain a white precipitate which should dissolve upon reaching room temperature. **Reconstitute only with the provided diluent.** Dilute the 15 mg vial with 8 mL and the 45 mg vial with 23.5 mL (using provided diluent) to a concentration of 2 mg/mL (contains overfill). Gently swirl and invert vial until dissolved completely. Prior to administration, further dilute in lactated Ringer's (~250 mL) using a non-DEHP container (eg, glass, polypropylene or polyolefin), to a final concentration of 0.2-0.6 mg/mL.

CompatibilityStable in lactated Ringer's injection.

ContraindicationsHistory of severe hypersensitivity to Cremophor® EL or its derivatives (eg, polyoxyethylated castor oil); neutrophil count <1500/mm^3 or platelet count <100,000mm^3; combination therapy with ixabepilone and capecitabine in patients with AST or ALT >2.5 times ULN or bilirubin >1 times ULN

Warnings/Precautions

Boxed Warnings:

- Hepatic impairment: See "Disease-related concerns" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Dose dependant myelosuppression, particularly neutropenia, may occur with mono- or combination therapy. Neutropenic fever and infection have been reported with use. The risk for neutropenia is increased with hepatic dysfunction, especially when used in combination with capecitabine. Severe neutropenia and/or thrombocytopenia may require dosage adjustment and/or treatment delay.

- Cognitive impairment: Due to the ethanol content in the diluent, may cause cognitive impairment; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Hypersensitivity: Diluent contains Cremophor® EL, which is associated with hypersensitivity reactions; use is contraindicated in patients with a history of severe hypersensitivity to Cremophor® EL. Medications for the treatment of reaction should be available for immediate use; reactions may also be managed by reducing infusion rate. Premedicate with an H_1- and H_2-antagonist 1 hour prior to infusion; patients who experience hypersensitivity (eg, bronchospasm, dyspnea, flushing, rash) should also be premedicated with a corticosteroid for all subsequent cycles if treatment is continued.

- Peripheral neuropathy: Peripheral (sensory and motor) neuropathy occurs commonly; may require dose reductions, treatment delays or discontinuation. Usually occurs during the first 3 cycles. Use with caution in patients with pre-existing neuropathy.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease. The incidence of MI, ventricular dysfunction and supraventricular arrhythmias is higher when ixabepilone is used in combination with capecitabine (as compared to capecitabine alone). Consider discontinuing ixabepilone in patients who develop cardiac ischemia or impaired cardiac function.

- Diabetes: Use with caution; may have an increased risk for severe peripheral neuropathy.

- Hepatic impairment: **[U.S. Boxed Warning]: Combination therapy with capecitabine is contraindicated in patients with AST or ALT >2.5 times ULN or bilirubin >1 times ULN;** the risk of toxicity and neutropenia-related death is increased. Use (as monotherapy) is not recommended if AST or ALT >10 times ULN or bilirubin >3 times ULN; use caution in patients with AST or ALT >5 times ULN; data is limited. In mono- and combination therapy, toxicities and serious adverse reactions are increased with hepatic dysfunction; dosage reductions are necessary.

Special populations:

- Elderly: Use with caution in the elderly; toxicities or serious adverse events with combination therapy may be increased.

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD

Pregnancy ConsiderationsIn animal studies, ixabepilone caused maternal toxicity and embryo/fetal toxicity at doses ~1/10 the human dose. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to use effective contraception during treatment.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reaction in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

Percentages reported with monotherapy:

>10%:

Central nervous system: Headache (11%)

Dermatologic: Alopecia (48%)

Gastrointestinal: Nausea (42%), vomiting (29%), mucositis/stomatitis (29%), diarrhea (22%), anorexia (19%), constipation (16%), abdominal pain (13%)

Hematologic: Leukopenia (36%; grade 4: 13%), neutropenia (31%; grade 4: 23%)

Neuromuscular & skeletal: Peripheral neuropathy (~75%; grades 3/4: 14%; median onset: cycle 4), sensory neuropathy (62%; grades 3/4: 14%), weakness (56%), myalgia/arthralgia (49%), musculoskeletal pain (20%)

1% to 10%:

Cardiovascular: Edema (9%), hot flush (6%), chest pain (5%)

Central nervous system: Fever (8%), pain (8%), dizziness (7%), insomnia (5%)

Dermatologic: Nail disorder (9%), rash (9%), palmar-plantar erythrodysesthesia/hand-and-foot syndrome (8%), pruritus (6%), skin exfoliation (2%), hyperpigmentation (2%)

Endocrine & metabolic: Dehydration (2%)

Gastrointestinal: Gastroesophageal reflux disease (6%), taste perversion (6%), weight loss (6%)

Hematologic: Anemia (6%; grade 4: 2%), neutropenic fever (3%; grade 3: 3%), thrombocytopenia (5%; grade 4: 2%)

Neuromuscular & skeletal: Motor neuropathy (10%; grade 3: 1%)

Ocular: Lacrimation increased (4%)

Respiratory: Dyspnea (9%), upper respiratory tract infection (6%), cough (2%)

Miscellaneous: Hypersensitivity (5%; grade 3: 1%), infection (5%)

Mono- and combination therapy: <1%, postmarketing, and/or case reports (limited to important or life-threatening): Alkaline phosphatase increased, angina, atrial flutter, autonomic neuropathy, cardiomyopathy, cerebral hemorrhage, coagulopathy, colitis, embolism, dysphagia, enterocolitis, erythema multiforme, gastrointestinal hemorrhage, gastroparesis, GGT increased, hemorrhage, hepatic failure (acute), hypokalemia, hyponatremia, hypotension, hypovolemia, hypovolemic shock, hypoxia, ileus, interstitial pneumonia, jaundice, left ventricular dysfunction, metabolic acidosis, MI, nephrolithiasis, neutropenic infection, orthostatic hypotension, pneumonia, pneumonitis, pulmonary edema (acute), renal failure, respiratory failure, sepsis, septic shock, supraventricular arrhythmia, syncope, thrombosis, transaminases increased, trismus, urinary tract infection, vasculitis

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John’s wort (may decrease ixabepilone levels).

Monitoring ParametersCBC with differential; hepatic function (ALT, AST, bilirubin); monitor for hypersensitivity

Nursing: Physical Assessment/MonitoringUse caution with hepatic dysfunction, pre-existing neuropathy, or cardiovascular disease. Assess potential for interactions with other pharmacological or herbal agents patient may be taking (eg, risk of toxicity, decreased effects). Premedication prior to administration is recommended. Patient must be monitored closely for hypersensitivity reaction and treatment for reaction should be immediately available. In case of adverse infusion reactions, infusion should be stopped and prescriber notified; reduced infusion rate may be necessary. Teach patient possible side effects/interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential; hepatic function (ALT, AST, bilirubin)

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy unless approved by prescriber. This medication can only be administered by infusion and you will be closely monitored during each infusion. Report immediately unusual chest tightness; difficulty breathing or swallowing; itching or skin rash; back pain or acute headache; or redness, swelling, or pain at infusion site. Maintain adequate nutrition (small, frequent meals) and hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience dizziness, headache, insomnia, or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may reduce diarrhea); constipation (increased dietary fruit, fluids, fiber, or increased exercise may help); tingling, numbness, or loss of sensation in hands or feet; or loss of hair (may regrow when treatment is ended). Report chest pain or palpitations; swelling of extremities; difficulty breathing or unusual cough; persistent or unresolved gastrointestinal disturbance; weakness, numbness, tingling, or tremors in muscles; skin rash or change in pigmentation; unusual fatigue; or any other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Ixempra™: 15 mg, 45 mg [packaged with diluent; diluent contains alcohol and purified polyoxyethylated castor oil (Cremophor® EL)]

Generic AvailableNo

ManufacturerBristol-Myers Squibb Company

Mechanism of ActionEpothilone B analog; binds to the beta-tubulin subunit of the microtubule, stabilizing microtubular function, thus arresting the cell cycle (at the G2/M phase) and inducing apoptosis

Pharmacodynamics/Kinetics

Distribution: >1000 L/m^2

Protein binding: 67% to 77%

Metabolism: Extensively hepatic, via CYP3A4; >30 metabolites (inactive) formed

Half-life elimination: ~52 hours

Time to peak, plasma: At the end of infusion (3 hours)

Excretion: Feces (65%; 2% as unchanged drug); urine (21%; 6% as unchanged drug)

Related Information

- Common Toxicity Criteria
- Management of Nausea and Vomiting
- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, mucositis, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause cognitive impairment, dizziness, and insomnia

Mental Health: Effects on Psychiatric TreatmentIxabepilone causes bone marrow depression; use caution with clozapine, carbamazepine, and valproic acid. GI side effects are common; concomitant use with lithium, SSRIs, valproic acid, and carbamazepine may produce additive effects. Carbamazepine, phenobarbital, and St John's wort may decrease the levels/effects of ixabepilone; avoid concurrent use. Nefazodone may increase the levels/effects of ixabepilone; avoid concurrent use.

Japanese Encephalitis Virus Vaccine (Inactivated)

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(jap a NEESE en sef a LYE tis VYE rus vak SEEN, in ak ti VAY ted)
U.S. Brand NamesJE-VAX®
Canadian Brand NamesJE-VAX®
Pharmacologic CategoryVaccine
Use: Labeled IndicationsActive immunization against Japanese encephalitis
Dosing: Adults

U.S. recommended primary immunization schedule: SubQ: Three 1 mL doses given on days 0, 7, and 30

Booster dose: Give after 2 years, or according to current recommendation

Abbreviated dosing schedule: Three recommended doses, given on days 0, 7, and 14 with the last dose given at least 10 days before travel. Alternately, two doses given 1 week apart provide immunity in ~80% of patients. Abbreviated schedules should be used only when necessary due to time constraints.

Dosing: ElderlyRefer to adult dosing. Elderly may be at increased risk of developing neuroinvasive disease if infected with Japanese encephalitis virus.
Dosing: Pediatric

U.S. recommended primary immunization schedule: SubQ:

Children 1-3 years: Three 0.5 mL doses given on days 0, 7, and 30

Children >3 years: Three 1 mL doses given on days 0, 7, and 30

Booster dose: Give after 2 years, or according to current recommendation

Abbreviated dosing schedule: Three recommended doses, given on days 0, 7, and 14 with the last dose given at least 10 days before travel. Alternately, two doses given 1 week apart provide immunity in ~80% of patients. Abbreviated schedules should be used only when necessary due to time constraints.

Dietary ConsiderationsAvoid alcohol for 48 hours following vaccination.
StoragePrior to and following reconstitution, store under refrigeration at 2°C to 8°C (35°F to 46°F). Discard 8 hours after reconstitution. Do not freeze.
ReconstitutionReconstitute with 1.3 mL of provided diluent. Shake well.
ContraindicationsHypersensitivity to Japanese encephalitis virus vaccine, including serious adverse reaction (generalized urticaria or angioedema) to a prior dose; proven or suspected hypersensitivity to any component of the vaccine including proteins of rodent or neural origin; hypersensitivity to thimerosal
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use. Severe adverse reactions (generalized urticaria or angioedema) may occur within minutes to 17 days following vaccination; most occur within 10 days with the majority occurring within 48 hours. Patients should be observed for 30 minutes after vaccination. Travel should not be started for ≥10 days following vaccination and patients should remain within ready access to medical care for 10 days and seek immediate medical attention at onset of any reaction.

Disease-related concerns:

- Acute illness: The decision to administer or delay vaccination because of current or recent febrile illness depends on the severity of symptoms and the etiology of the disease. Immunization should be delayed during the course of an acute febrile illness.

- Drug allergies: Use with caution in patients with severe allergies to other medications.

- Insect sting urticaria: Use caution with a significant history of urticaria following exposure to insect stings; risk of adverse events may be increased.

Concurrent drug therapy issues:

- Alcohol: Avoid alcohol consumption within 48 hours of vaccination; may increase risk of hypersensitivity reactions.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy [including high dose corticosteroids]); may have a reduced response to vaccination.

- Patients residing/traveling to Asia: Because of the potential for severe adverse reactions, not recommended for all persons traveling to or residing in Asia (also see Additional Information or Pharmacotherapy Pearls).

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Other warnings/precautions:

- Other methods to reduce mosquito exposure: Use of vaccine should also include other means to reduce the risk of mosquito exposure (bed nets, insect repellents, protective clothing, avoidance of travel in endemic areas, and avoidance of outdoor activity during twilight and evening periods).

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Risks of vaccine administration should be carefully considered and in general, pregnant women should only be vaccinated if they are at high risk for exposure. Infection from Japanese encephalitis during the 1st or 2nd trimesters of pregnancy may increase risk of abortion.

Adverse Reactions**Report allergic or unusual adverse reactions to the Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.** Percentage of adverse reactions may depend upon timing of vaccination. In general, adverse reactions occur more frequently following the first dose or when doses are administered closer together (abbreviated dosing schedule). However, reactions have been reported when previous doses were tolerated uneventfully.

>10%:

Central nervous system: Headache (<5% to 15%)

Local: Injection site reaction (<1% to 31%)

1% to 10%:

Central nervous system: Chills (~10%), dizziness (~10%), malaise (~10%), fever (<5% to 10%)

Dermatologic: Rash (≤10%)

Gastrointestinal: Abdominal pain (~10%), nausea (~10%), vomiting (~10%)

Neuromuscular & skeletal: Myalgia (~10%)

Miscellaneous: Flu-like syndrome (<5%)

<1%, frequency not defined, and/or case reports: Angioedema, behavior disorder, Bell’s palsy, cerebellar ataxia, cranial nerve paresis, encephalopathy, erythema multiforme, erythema nodosum, facial swelling, Guillain-Barré syndrome, hepatitis, hives, hypotension, itching, joint swelling, myocarditis, optic neuritis, peripheral neuropathy, renal failure, respiratory distress, respiratory failure, seizure, transverse myelitis, urticaria (generalized), wheezing

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Alcohol consumption within 48 hours of vaccination may increase risk of hypersensitivity reactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

JE-VAX®: [contains mouse serum protein, thimerosal, gelatin, polysorbate 80]

Generic AvailableNo

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Because of the potential for severe adverse reactions, Japanese encephalitis vaccine is not recommended for all persons traveling to or residing in Asia. Risk of exposure to the Japanese encephalitis virus may vary from year to year for a particular area. In general, use should be limited to persons spending ≥1 month in endemic areas during transmission season. Under specific circumstances, the CDC notes that vaccination may also be considered for persons spending <30 days in endemic areas, such as:

- Travel to areas with epidemic transmission

- Travelers with high risk activities (eg, extensive outdoor activity in rural areas, adventure travelers)

The CDC also recommends vaccination for research laboratory workers who may be exposed to the Japanese encephalitis virus.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or malaise; may rarely cause encephalopathy

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Kanamycin may be confused with Garamycin®, gentamicin

Pronunciation(kan a MYE sin)

U.S. Brand NamesKantrex®

Canadian Brand NamesKantrex®

Pharmacologic CategoryAntibiotic, Aminoglycoside

Use: Labeled IndicationsTreatment of serious infections caused by susceptible strains of *E. coli*, *Proteus* species, *Enterobacter aerogenes*, *Klebsiella pneumoniae*, *Serratia marcescens*, and *Acinetobacter* species; second-line treatment of *Mycobacterium tuberculosis*

Dosing: Adults**Note:** Dosing should be based on ideal body weight

Susceptible systemic infections: I.M., I.V.: 5-7.5 mg/kg/dose in divided doses every 8-12 hours (<15 mg/kg/day)

Following surgical contamination, peritonitis: Intraperitoneal: 500 mg

Irrigating solution: 0.25%; maximum 1.5 g/day (via all administration routes)

Aerosol: 250 mg 2-4 times/day

Dosing: ElderlyI.M., I.V.: Initial dose should be 5-7.5 mg/kg based on ideal body weight (except in obese patients); maintenance dose and interval should be adjusted for estimated renal function; dosing interval in most older patients is every 12-24 hours (see Dosing in Renal Impairment).

Dosing: Pediatric**Note:** Dosing should be based on ideal body weight

Infections: I.M., I.V.: 15 mg/kg/day in divided doses every 8-12 hours

Dosing: Renal Impairment

Cl_{cr} 50-80 mL/minute: Administer 60% to 90% of dose or administer every 8-12 hours.

Cl_{cr} 10-50 mL/minute: Administer 30% to 70% of dose or administer every 12 hours.

Cl_{cr} <10 mL/minute: Administer 20% to 30% of dose or administer every 24-48 hours.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.M.Administer deeply in upper outer quadrant of the gluteal muscle.

Administration: I.V.Infuse over 30-60 minutes.

Some penicillins (eg, carbenicillin, ticarcillin and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

StorageStore vial at controlled room temperature. Darkening of vials does not indicate loss of potency.

Reconstitution

I.V.: Must be further diluted prior to I.V. infusion. For adults, dilute 500 mg in 100-200 mL of appropriate solution or 1 g in 200-400 mL. For pediatric patients, use sufficient amount to infuse solution over 30-60 minutes.

Intraperitoneal: Dilute dose in 20 mL sterile distilled water.

Aerosol: Dilute 250 mg in 3 mL normal saline.

CompatibilityStable in D_5NS, D_5W, $D_{10}W$, LR, NS; **variable stability (consult detailed reference)** in TPN.

Y-site administration: Compatible: Cyclophosphamide, furosemide, heparin with hydrocortisone sodium succinate, hydromorphone, magnesium sulfate, meperidine, morphine, perphenazine, potassium chloride, vitamin B complex with C. **Variable (consult detailed reference):** TPN.

Compatibility in syringe: Compatible: Penicillin G sodium. **Incompatible:** Ampicillin, heparin, piperacillin.

Compatibility when admixed: Compatible: Ascorbic acid injection, cefoxitin, chloramphenicol, clindamycin, dopamine, furosemide, penicillin G potassium, penicillin G sodium, polymyxin B sulfate, sodium bicarbonate, vitamin B complex with C. **Incompatible:** Amphotericin B, cefazolin, cefotaxime, cefotetan, chlorpheniramine, colistimethate, heparin, lincomycin, methohexital, phenobarbital, phenytoin, piperacillin. **Variable (consult detailed reference):** Hydrocortisone sodium succinate.

ContraindicationsHypersensitivity to kanamycin, any component of the formulation, or other aminoglycosides; pregnancy
Warnings/Precautions

Boxed warnings:

- Nephrotoxicity: See “Concerns related to adverse effects” below.

- Neurotoxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Nephrotoxicity: **[U.S. Boxed Warning]: May cause nephrotoxicity;** usual risk factors include pre-existing renal impairment, concomitant nephrotoxic medications, advanced age, and dehydration. Discontinue treatment if signs of nephrotoxicity occur; renal damage is usually reversible.

- Neuromuscular blockade and respiratory paralysis: May cause neuromuscular blockade and respiratory paralysis, especially when given soon after anesthesia or muscle relaxants.

- Neurotoxicity: **[U.S. Boxed Warning]: May cause neurotoxicity;** usual risk factors include pre-existing renal impairment, concomitant neuro-/nephrotoxic medications, advanced age, and dehydration. Ototoxicity is proportional to the amount of drug given and the duration of treatment. Tinnitus or vertigo may be indications of vestibular injury and impending bilateral irreversible damage. Discontinue treatment if signs of ototoxicity occur.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hearing impairment: Use with caution in patients with pre-existing vertigo, tinnitus, or hearing loss.

- Hypocalcemia: Use with caution in patients with hypocalcemia.

- Neuromuscular disorders: Use with caution in patients with neuromuscular disorders, including myasthenia gravis.

- Renal impairment: Use with caution in patients with pre-existing renal insufficiency; dosage modification required.

Other warnings/precautions:

- Long-term use: Not intended for long-term therapy due to toxic hazards associated with extended administration.

Geriatric ConsiderationsThis is not a drug of choice since elderly may have increased adverse effects (renal).
Pregnancy Risk FactorD
Pregnancy ConsiderationsKanamycin crosses the placenta and produces detectable serum levels in the fetus. There is one case report of hearing impairment in a child with prenatal exposure to kanamycin. Because of several reports of total irreversible bilateral congenital deafness in children whose mothers received streptomycin during pregnancy, kanamycin has been classified by the manufacturer as pregnancy risk category D.
LactationEnters breast milk/not recommended (AAP rates “compatible”)
Breast-Feeding ConsiderationsKanamycin is excreted into breast milk in minute amounts; however, it is not well absorbed when taken orally. This limited oral absorption may minimize exposure to the nursing infant. Nondose-related effects could include modification of bowel flora. The AAP considers kanamycin to be “usually compatible with breast-feeding.”
Pregnancy & Lactation, In-Depth

- Kanamycin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema

Central nervous system: Neurotoxicity, drowsiness, headache, pseudomotor cerebri

Dermatologic: Skin itching, redness, rash, photosensitivity, erythema

Gastrointestinal: Nausea, vomiting, diarrhea, malabsorption syndrome (with prolonged and high-dose therapy of hepatic coma), anorexia, weight loss, salivation increased, enterocolitis

Hematologic: Granulocytopenia, agranulocytosis, thrombocytopenia

Local: Burning, stinging

Neuromuscular & skeletal: Weakness, tremor, muscle cramps

Otic: Ototoxicity (auditory), ototoxicity (vestibular)

Renal: Nephrotoxicity

Respiratory: Dyspnea

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

Cardiac Glycosides: Aminoglycosides may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Test InteractionsSome penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersSerum creatinine and BUN every 2-3 days; peak and trough concentrations; hearing

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*. This may be clinically-significant for certain penicillin (ticarcillin, piperacillin, carbenicillin) and aminoglycoside (gentamicin, tobramycin) combination therapy in patients with significant renal impairment. Close monitoring of aminoglycoside levels is warranted.

Reference RangeTherapeutic: Peak: 15-30 mcg/mL; Trough: 5-10 mcg/mL; Toxic: Peak: >35 mcg/mL; Trough: >10 mcg/mL

Monitoring: Lab TestsSerum creatinine and BUN every 2-3 days; peak and trough concentrations

Patient EducationReport persistent diarrhea.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sulfate: 1 g/3 mL (3 mL) [contains sodium bisulfate]

Generic AvailableNo

ManufacturerGeneva Pharmaceuticals

Mechanism of ActionInterferes with protein synthesis in bacterial cell by binding to ribosomal subunit

Pharmacodynamics/Kinetics

Absorption:

I.M.: Rapid

Oral: Minimal

Distribution:

Relative diffusion from blood into CSF: Good only with inflammation (exceeds usual MICs)

CSF:blood level ratio: Normal meninges: Nil; Inflamed meninges: 43%

Protein binding: 0%

Half-life elimination: 2-4 hours; Anuria: 80 hours; End-stage renal disease: 40-96 hours

Time to peak, serum: I.M.: 1-2 hours (decreased in burn patients)

Excretion: Urine (as unchanged drug)

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ketalar® may be confused with Kenalog®, ketorolac

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(KEET a meen)
U.S. Brand NamesKetalar®
Canadian Brand NamesKetalar®; Ketamine Hydrochloride Injection, USP
Pharmacologic Category[General Anesthetic]
Use: Labeled IndicationsInduction and maintenance of general anesthesia
Use: Unlabeled/InvestigationalAnalgesia, sedation
Dosing: AdultsMay be used in combination with anticholinergic agents to decrease hypersalivation.

Induction of anesthesia:

I.M.: 6.5-13 mg/kg; usual dose to produce 12-25 minutes of anesthesia: 10 mg/kg

I.V.: 1-4.5 mg/kg; usual dose to produce 5-10 minutes of anesthesia: 2 mg/kg

I.V. infusion: 1-2 mg/kg infuse over 0.5 mg/kg/minute; may administer with diazepam to prevent emergence reactions

Maintenance of anesthesia: Supplemental doses of $^1/_2$ to the full induction dose; may also be maintained with a continuous infusion of 0.1-5 mg/minute

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricMay be used in combination with anticholinergic agents to decrease hypersalivation. **Note:** Titrate dose for desired effect.

Sedation (unlabeled use):

Oral (unlabeled route): 6-10 mg/kg for 1 dose (mixed in 0.2-0.3 mL/kg of cola or other beverage) given 30 minutes before the procedure

Continuous I.V. infusion: 5-20 mcg/kg/minute; titrate to reach desired level of sedation

Sedation/analgesia (unlabeled use):

I.M.: 4-5 mg/kg/dose; doses up to 13 mg/kg have been reported

I.V.: 1-2 mg/kg/dose; titrate repeat doses for desired effect

Children ≥16 years: Refer to adult dosing.

Administration: I.V.Do not exceed 0.5 mg/kg/minute or administer faster than 60 seconds. Solutions for infusion should not exceed final concentration of 2 mg/mL.
Administration: OralUse 100 mg/mL I.V. solution and mix the appropriate dose in 0.2-0.3 mL/kg of cola or other beverage.
StorageStore at 20°C to 25°C (68°F to 77°F). Protect from light.
ReconstitutionThe 50 mg/mL and 100 mg/mL vials may be further diluted in D_5W or NS to a final concentration of 1 mg/mL (or 2 mg/mL in patients with fluid restrictions). The 10 mg/mL vials are not recommended to be further diluted. Do not mix with barbiturates or diazepam (precipitation may occur).
CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Propofol.

Compatibility in syringe: Compatible: Bupivacaine with fentanyl, clonidine with tetracaine, lidocaine with morphine, meperidine, morphine. **Incompatible:** Amobarbital, diazepam, doxapram, methohexital, pentobarbital, phenobarbital, secobarbital, thiopental.

Compatibility when admixed: Compatible: Morphine.

RestrictionsC-III
ContraindicationsHypersensitivity to ketamine or any component of the formulation; conditions in which an increase in blood pressure would be hazardous
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). When used on an outpatient basis, patient should be accompanied by a responsible adult.

- Dependence: May cause dependence (withdrawal symptoms on discontinuation) and tolerance with prolonged use.

- Emergence reactions: Postanesthetic emergence reactions which can manifest as vivid dreams, hallucinations, and/or frank delirium occur; these reactions are less common in patients >65 years of age and when given intramuscularly. Emergence reactions, confusion, or irrational behavior may occur up to 24 hours postoperatively and may be reduced by pretreatment with a benzodiazepine and the use of ketamine at the lower end of the dosing range.

- Respiratory depression: Rapid I.V. administration or overdose may cause respiratory depression, apnea, and enhanced pressor response. Resuscitative equipment should be available during use.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease, catecholamine depletion, hypertension, and tachycardia. Cardiac function should be continuously monitored in patients with increased blood pressure or cardiac decompensation.

- Cerebrospinal fluid (CSF) pressure elevation: Use with caution in patients with CSF pressure elevation; an increase in CSF pressure is associated with use.

- Ethanol use: Use with caution in the chronic alcoholic or acutely alcohol-intoxicated.

Other warnings/precautions:

- Experienced physician: Should be administered under the supervision of a physician experienced in administering general anesthetics.

Pregnancy ConsiderationsAdverse events have not been observed in animal reproduction studies. Ketamine crosses the placenta and can be detected in fetal tissue. Ketamine produces dose dependant increases in uterine contractions; effects may vary by trimester. The plasma clearance of ketamine is reduced during pregnancy. Dose related neonatal depression and decreased APGAR scores have been reported with large doses administered at delivery.

Adverse ReactionsFrequency not always defined.

Cardiovascular: Arrhythmia, bradycardia, hyper-/hypotension, pulse rate increased

Central nervous system: CSF pressure increased

Dermatologic: Erythema (transient), morbilliform rash (transient)

Gastrointestinal: Anorexia, nausea, vomiting

Local: Pain at the injection site, exanthema at the injection site

Neuromuscular & skeletal: Skeletal muscle tone enhanced (tonic-clonic movements)

Ocular: Diplopia, intraocular pressure increased, nystagmus

Respiratory: Airway obstruction, apnea, respiratory depression or stimulation, laryngospasm

Miscellaneous: Anaphylaxis, dependence with prolonged use, emergence reactions (~12%; includes confusion, delirium, dreamlike state, excitement, hallucinations, irrational behavior, vivid imagery)

Metabolism/Transport Effects**Substrate** (major) of CYP2B6, 2C9, 3A4

Drug Interactions

CYP2B6 Inhibitors (Moderate): May decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Inhibitors (Strong): May decrease the metabolism of CYP2B6 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Monitoring ParametersHeart rate, blood pressure, respiratory rate, transcutaneous O_2 saturation, emergence reactions; cardiac function should be continuously monitored in patients with increased blood pressure or cardiac decompensation

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effect, and adverse/toxic effects. Keep patient under observation. Monitor cardio/respiratory status and institute patient safety precautions. Monitor effectiveness of therapy and adverse reactions. Monitor respiratory status (for conscious sedation, includes pulse oximetry), cardiovascular status, CNS status (when used for procedures monitor sedation score); cardiac monitor and blood pressure monitor required.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 50 mg/mL (10 mL); 100 mg/mL (5 mL)

Ketalar®: 10 mg/mL (20 mL); 50 mg/mL (10 mL); 100 mg/mL (5 mL)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Ketamine HCl)

50 mg/mL (10): $7.69

Mechanism of ActionProduces a cataleptic-like state in which the patient is dissociated from the surrounding environment by direct action on the cortex and limbic system. Releases endogenous catecholamines (epinephrine, norepinephrine) which maintain blood pressure and heart rate. Reduces polysynaptic spinal reflexes.

Pharmacodynamics/Kinetics

Onset of action:

I.V.: Anesthetic effect: 30 seconds

I.M.: Anesthetic effect: 3-4 minutes

Duration: Anesthetic effect: I.V.: 5-10 minutes; I.M.: 12-25 minutes

Metabolism: Hepatic via hydroxylation and N-demethylation; the metabolite norketamine is 33% as potent as parent compound

Half-life elimination: Alpha: 10-15 minutes; Beta: 2.5 hours

Excretion: Primarily urine

Pharmacotherapy PearlsProduces emergence psychosis including auditory and visual hallucinations, restlessness, disorientation, vivid dreams, and irrational behavior in ~12% of patients; pretreatment with a benzodiazepine reduces incidence of psychosis by >50%. Spontaneous involuntary movements, nystagmus, hypertonus, and vocalizations are also commonly seen.

The analgesia outlasts the general anesthetic component. Bronchodilation is beneficial in asthmatic or COPD patients. Laryngeal reflexes may remain intact or may be obtunded. The direct myocardial depressant action of ketamine can be seen in stressed, catecholamine-deficient patients. Ketamine increases cerebral metabolism and cerebral blood flow while producing a noncompetitive block of the neuronal postsynaptic NMDA receptor. It lowers seizure threshold and stimulates salivary secretions (atropine/scopolamine treatment is recommended).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Increased salivation.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusVivid dreams and hallucinations common

Mental Health: Effects on Psychiatric TreatmentContraindicated in patients with psychotic disorders; barbiturates and hydroxyzine may increase the effects of ketamine; avoid combination

Cardiovascular ConsiderationsKetamine increases myocardial demand secondary to catecholamine release.

Anesthesia and Critical Care Concerns/Other ConsiderationsProduces emergence psychosis including auditory and visual hallucinations, restlessness, disorientation, vivid dreams, and irrational behavior in ~12% of patients; pretreatment with a benzodiazepine reduces incidence of psychosis by >50%. Spontaneous involuntary movements, nystagmus, hypertonus, and vocalizations are also commonly seen.

The analgesia outlasts the general anesthetic component. Bronchodilation is beneficial in asthmatic or COPD patients. Laryngeal reflexes may remain intact or may be obtunded. The direct myocardial depressant action of ketamine can be seen in stressed, catecholamine-deficient patients. Ketamine increases cerebral metabolism and cerebral blood flow while producing a noncompetitive block of the neuronal postsynaptic NMDA receptor. It lowers seizure threshold and stimulates salivary secretions (atropine/scopolamine treatment is recommended).

Ketamine increases myocardial oxygen demand secondary to catecholamine release.

Index TermsKetamine Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Kuric™ may be confused with Carac®

Nizoral® may be confused with Nasarel®, Neoral®, Nitrol®

Pronunciation(kee toe KOE na zole)

U.S. Brand NamesExtina®; Kuric™; Nizoral®; Nizoral® A-D [OTC]; Xolegel™

Canadian Brand NamesApo-Ketoconazole®; Ketoderm®; Novo-Ketoconazole; Xolegel™

Pharmacologic CategoryAntifungal Agent, Oral; Antifungal Agent, Topical

Use: Labeled Indications

Systemic: Treatment of susceptible fungal infections, including candidiasis, oral thrush, blastomycosis, histoplasmosis, paracoccidioidomycosis, coccidioidomycosis, chromomycosis, candiduria, chronic mucocutaneous candidiasis, as well as certain recalcitrant cutaneous dermatophytoses

Topical:

Cream: Treatment of tinea corporis, tinea cruris, tinea versicolor, cutaneous candidiasis, seborrheic dermatitis

Foam, gel: Treatment of seborrheic dermatitis

Shampoo: Treatment of dandruff, seborrheic dermatitis, tinea versicolor

Use: Unlabeled/InvestigationalTablet: Treatment of prostate cancer (androgen synthesis inhibitor)

Use: DentalTreatment of susceptible fungal infections in the oral cavity including candidiasis, oral thrush, and chronic mucocutaneous candidiasis

Dosing: Adults

Fungal infections:

Oral: 200-400 mg/day as a single daily dose

Topical: Tinea infections: Cream: Rub gently into the affected area once daily. Duration of treatment: Tinea corporis, cruris: 2 weeks; tinea pedis: 6 weeks

Shampoo: Tinea versicolor: Apply twice weekly for 4 weeks with at least 3 days between each shampoo

Seborrheic dermatitis:*Topical:*

Cream: Rub gently into the affected area twice daily for 4 weeks or until clinical response is noted.

Foam: Apply to affected area twice daily for 4 weeks

Gel: Rub gently into the affected area once daily for 2 weeks.

Shampoo: Apply twice weekly for 4 weeks with at least 3 days between each shampoo

Prostate cancer (unlabeled use): Oral: Adults: 400 mg 3 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Fungal infections:***Oral:* Children ≥2 years: 3.3-6.6 mg/kg/day as a single dose for 1-2 weeks for candidiasis, for at least 4 weeks in recalcitrant dermatophyte infections, and for up to 6 months for other systemic mycoses

Seborrheic dermatitis:*Topical (cream/foam/gel, shampoo):* Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentNot dialyzable (0% to 5%)

Dosing: Hepatic ImpairmentDose reductions should be considered in patients with severe liver disease.

Dosing: Combination Regimens

Prostate cancer:

Doxorubicin + Ketoconazole

Doxorubicin + Ketoconazole/Estramustine + Vinblastine

Administration: OralAdminister oral tablets 2 hours prior to antacids to prevent decreased absorption due to the high pH of gastric contents.

Administration: TopicalCream, foam, gel, and shampoo are for external use only. Avoid exposure to flame or smoking immediately following application of gel or foam; do not apply directly to hands.

Dietary ConsiderationsTablet: May be taken with food or milk to decrease GI adverse effects.

Storage

Cream: Store at <25°C (<77°F).

Foam: Store at 20°C to 25°C (68°F to 77°F). Do not refrigerate. Do not store in direct sunlight. Contents are flammable.

Gel: Store at 15°C to 30°C (59°F to 86°F).

Shampoo: Store between 2°C to 30°C (35°F to 86°F); protect from freezing. Protect from light.

Tablet: Store at 15°C to 25°C (59°F to 77°F).

Extemporaneously PreparedA 20 mg/mL suspension may be made by pulverizing twelve 200 mg ketoconazole tablets to a fine powder; add 40 mL Ora-Plus® in small portions with thorough mixing; incorporate Ora-Sweet® to make a final volume of 120 mL and mix thoroughly; refrigerate (no stability information is available)

Allen LV, "Ketoconazole Oral Suspension," *US Pharm*, 1993, 18(2):98-9, 101.

ContraindicationsHypersensitivity to ketoconazole or any component of the formulation; CNS fungal infections (due to poor CNS penetration); coadministration with ergot derivatives or cisapride is contraindicated due to risk of potentially fatal cardiac arrhythmias

Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Boxed warnings:

- Cisapride: See "Concurrent drug therapy issues" below.
- Hepatic impairment: See "Disease-related concerns" below.

Concerns related to adverse effects:

- Adrenal suppression: High doses of ketoconazole may depress adrenocortical function.

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Ketoconazole has been associated with hepatotoxicity, including some fatalities;** use with caution in patients with pre-existing hepatic impairment; monitor liver function closely and dosage adjustment may be warranted.

Concurrent drug therapy issues:

- Cisapride: **[U.S. Boxed Warning]: Concomitant use with cisapride is contraindicated due to the occurrence of ventricular arrhythmias.**

Dosage form specific issues:

- Foam: Formulation contains alcohol and propane/butane; do not expose to open flame or smoking during or immediately after application. Do not puncture or incinerate container.
- Topical: Formulations may contain sulfites. Avoid exposure of gel to open flames during or immediately after application.

Geriatric ConsiderationsNo specific recommendations.

Pregnancy Risk FactorC

Pregnancy Considerations

Teratogenic effects were noted in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/not recommended

Adverse Reactions

Oral:

1% to 10%:

Dermatologic: Pruritus (2%)

Gastrointestinal: Nausea/vomiting (3% to 10%), abdominal pain (1%)

<1%: Bulging fontanelles, chills, depression, diarrhea, dizziness, fever, gynecomastia, headache, hemolytic anemia, hepatotoxicity, impotence, leukopenia, photophobia, somnolence, thrombocytopenia

Topical cream/gel: Allergic reaction, contact dermatitis (possibly related to sulfites or propylene glycol), facial swelling, headache, impetigo, local burning, ocular irritation, paresthesia, pruritus, severe irritation, stinging (~5%)

Topical foam: Application site burning (10%), application site reaction (6%), contact sensitization, dryness, erythema, pruritus, rash

Shampoo: Abnormal hair texture, hair loss increase, irritation (<1%), itching, mild dryness of skin, oiliness/dryness of hair, scalp pustules

Metabolism/Transport Effects **Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (strong), 2A6 (moderate), 2B6 (weak), 2C8 (weak), 2C9 (strong), 2C19 (moderate), 2D6 (moderate), 3A4 (strong)

Drug Interactions

Alfentanil: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Aliskiren: Ketoconazole may increase the serum concentration of Aliskiren. *Risk C: Monitor therapy*

Almotriptan: Ketoconazole may increase the serum concentration of Almotriptan. *Risk C: Monitor therapy*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amphotericin B: Antifungal Agents (Azole Derivatives, Systemic) may diminish the therapeutic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Aprepitant: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Aprepitant. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Quazepam. *Risk D: Consider therapy modification*

Bosentan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Bosentan. *Risk C: Monitor therapy*

BusPIRone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Busulfan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Busulfan. *Risk C: Monitor therapy*

Calcium Channel Blockers: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CarBAMazepine. *Risk C: Monitor therapy*

Cardiac Glycosides: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Cinacalcet: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Cinacalcet. *Risk C: Monitor therapy*

Cisapride: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

Conivaptan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Conivaptan. *Risk X: Avoid combination*

Corticosteroids (Orally Inhaled): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2A6 Substrates: CYP2A6 Inhibitors (Moderate) may decrease the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). Enteric coated didanosine capsules are not expected to affect these antifungals. *Risk D: Consider therapy modification*

Docetaxel: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Docetaxel. *Risk D: Consider therapy modification*

Dofetilide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Dofetilide. *Risk X: Avoid combination*

Eletriptan: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eplerenone. *Risk D: Consider therapy modification*

Erlotinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Erlotinib. *Risk C: Monitor therapy*

Eszopiclone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Eszopiclone. *Risk C: Monitor therapy*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fexofenadine: Ketoconazole may increase the serum concentration of Fexofenadine. *Risk C: Monitor therapy*

Fosaprepitant: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Fosaprepitant. Specifically, concentrations of aprepitant are likely to be increased. *Risk C: Monitor therapy*

Gefitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Gefitinib. *Risk C: Monitor therapy*

Grapefruit Juice: May increase the metabolism of Antifungal Agents (Azole Derivatives, Systemic). This specifically applies to oral antifungal administration. *Risk D: Consider therapy modification*

H2-Antagonists: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Imatinib. *Risk C: Monitor therapy*

Irinotecan: Antifungal Agents (Azole Derivatives, Systemic) may enhance the adverse/toxic effect of Irinotecan. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Losartan: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methadone: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Methadone. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Phenytoin. Phenytoin may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Praziquantel: Ketoconazole may increase the serum concentration of Praziquantel. Management: Praziquantel dose may need to be reduced when used with ketoconazole. *Risk D: Consider therapy modification*

Protease Inhibitors: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May decrease the serum concentration of Ketoconazole. Ketoconazole may increase the serum concentration of Proton Pump Inhibitors. *Risk D: Consider therapy modification*

QuiNIDine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of QuiNIDine. Management: Itraconazole, voriconazole, and posaconazole are specifically contraindicated with quinidine. Use of quinidine with any azole antifungal may require quinidine dose adjustment and should be done with caution and close monitoring. *Risk X: Avoid combination*

Ramelteon: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ramelteon. *Risk C: Monitor therapy*

Ranolazine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Repaglinide. Management: Concurrent use of an azole antifungal with both repaglinide and gemfibrozil should be avoided. *Risk C: Monitor therapy*

Rifamycin Derivatives: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Rifamycin Derivatives. Only rifabutin appears to be affected. Rifamycin Derivatives may decrease the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Sirolimus. Management: Sirolimus dose reductions of up to 50-90% may be necessary when starting an azole antifungal. Use of sirolimus with the azole antifungals voriconazole and posaconazole is contraindicated. *Risk D: Consider therapy modification*

Solifenacin: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Solifenacin. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Sucralfate: May decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). *Risk C: Monitor therapy*

Sunitinib: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Sunitinib. *Risk D: Consider therapy modification*

Tacrolimus: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Temsirolimus: Antifungal Agents (Azole Derivatives, Systemic) may increase the serum concentration of Temsirolimus. Concentrations of the active metabolite, sirolimus, are likely to be increased more substantially than those of the parent temsirolimus. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Tolterodine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Tolterodine. This is likely only of concern in CYP2D6-deficient patients (ie, "poor metabolizers") *Risk D: Consider therapy modification*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

VinCRIStine: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of VinCRIStine. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Ketoconazole may increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Ziprasidone. *Risk C: Monitor therapy*

Zolpidem: Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Zolpidem. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Ketoconazole peak serum levels may be prolonged if taken with food.

Herb/Nutraceutical: St John's wort may decrease ketoconazole levels.

Monitoring ParametersLiver function tests

Nursing: Physical Assessment/MonitoringEvaluate hepatic function prior to beginning therapy. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, anything that reduces gastric acidity may result in treatment failures with ketoconazole, concurrent use of ergot derivatives or cisapride increases the risk of potentially fatal cardiac arrhythmias, oral contraceptive efficacy may be reduced). Assess liver function, therapeutic effect (resolution of viral infection), and adverse reactions on a regular basis. Instruct patients with diabetes to monitor glucose levels closely; may impact effectiveness of oral hypoglycemics. Teach patient proper use (administration or application) and necessity of completing full therapy, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsLiver function

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Oral formulations may be taken with food, at least 2 hours before any antacids. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Cream, foam, gel, and shampoo are for external use only. Use full course of medication as directed; some infections may require long periods of therapy. If you have diabetes, test serum glucose regularly; may impact effectiveness of oral hypoglycemics. May cause nausea and vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report unresolved headache, rash or itching, yellowing of eyes or skin, changes in color of urine or stool, chest pain or palpitations, sense of fullness or ringing in ears, or if condition worsens. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Cream, foam, and gel: Apply exactly as directed. Wash hands thoroughly before and after applying; keep away from eyes or mouth. Keep Extina foam can away from open fire, flame, or direct heat (Extina foam is flammable). You may experience some burning, dryness, irritation, or rash at site of application. Report severe or persistent adverse effects or if condition worsens.

Shampoo: Use as directed. May cause some temporary hair loss, scalp irritation, itching, or change in hair texture. Report severe or persistent adverse effects or if condition worsens.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, topical [foam]:

Extina®: 2% (50 g, 100 g)

Cream, topical: 2% (15 g, 30 g, 60 g)

Kuric™: 2%: (75 g)

Gel, topical:

Xolegel™: 2% (15 g) [contains dehydrated alcohol 34%]

Shampoo, topical: 1% (120 mL), 2% (120 mL)

Nizoral®: 2% (120 mL)

Nizoral® A-D: 1% (120 mL, 210 mL)

Tablet: 200 mg

Generic AvailableYes: Cream, shampoo, tablet

Pricing: U.S. (www.drugstore.com)

Cream (Kuric)

2% (25): $45.99

2% (75): $97.42

Foam (Extina)

2% (100): $334.85

Gel (Xolegel)

2% (15): $112.73

Shampoo (Ketoconazole)

2% (120): $27.98

Shampoo (Nizoral)

2% (120): $48.35

Tablets (Ketoconazole)

200 mg (14): $30.99

Tablets (Nizoral)

200 mg (14): $64.27

Mechanism of ActionAlters the permeability of the cell wall by blocking fungal cytochrome P450; inhibits biosynthesis of triglycerides and phospholipids by fungi; inhibits several fungal enzymes that results in a build-up of toxic concentrations of hydrogen peroxide; also inhibits androgen synthesis

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid (~75%); Shampoo: None; Gel: Minimal

Distribution: Well into inflamed joint fluid, saliva, bile, urine, breast milk, sebum, cerumen, feces, tendons, skin and soft tissue, and testes; crosses blood-brain barrier poorly; only negligible amounts reach CSF

Protein binding: 93% to 96%

Metabolism: Partially hepatic via CYP3A4 to inactive compounds

Bioavailability: Decreases as gastric pH increases

Half-life elimination: Biphasic: Initial: 2 hours; Terminal: 8 hours

Time to peak, serum: 1-2 hours

Excretion: Feces (57%); urine (13%)

Related Information

- Antacid Drug Interactions
- Antifungal Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, or depression
Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine
Cardiovascular ConsiderationsKetoconazole may increase cyclosporine levels by up to 50% at high doses. It may also potentiate the anticoagulant effect of warfarin and can increase lovastatin and simvastatin levels. Concomitant administration with cisapride is contraindicated.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ketoprofen may be confused with ketotifen

Oruvail® may be confused with Clinoril®, Elavil®

Pronunciation(kee toe PROE fen)

Canadian Brand NamesApo-Keto SR®; Apo-Keto-E®; Apo-Keto®; Novo-Keto; Novo-Keto-EC; Nu-Ketoprofen; Nu-Ketoprofen-E; Oruvail®; Rhodis SR™; Rhodis-EC™; Rhodis™

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsAcute and long-term treatment of rheumatoid arthritis and osteoarthritis; primary dysmenorrhea; mild-to-moderate pain

Use: DentalManagement of pain and swelling

Dosing: Adults**Note:** The extended release formulation is not recommended for the treatment of acute pain.

Rheumatoid arthritis or osteoarthritis: Oral:

Regular release: 50 mg 4 times/day **or** 75 mg 3 times/day; up to a maximum of 300 mg/day

Extended release: 200 mg once daily

Note: Lower doses may be used in small patients or in the elderly, or debilitated.

Dysmenorrhea, mild-to-moderate pain: Oral: Regular release: 25-50 mg every 6-8 hours up to a maximum of 300 mg/day

Dosing: ElderlyInitial: 25-50 mg 3-4 times/day; increase up to 150-300 mg/day (maximum daily dose: 300 mg)

Dosing: Renal ImpairmentIn general, NSAIDs are not recommended for use in patients with advanced renal disease, but the manufacturer of ketoprofen does provide some guidelines for adjustment in renal dysfunction:

Mild impairment: Maximum dose: 150 mg/day

Severe impairment: Cl_{cr} <25 mL/minute: Maximum dose: 100 mg/day

Dosing: Hepatic ImpairmentHepatic impairment and serum albumin <3.5 g/dL: Maximum dose: 100 mg/day

Calculations

- Creatinine Clearance: Adults

Administration: OralMay take with food to reduce GI upset. Do not crush or break extended release capsules.

Dietary ConsiderationsIn order to minimize gastrointestinal effects, ketoprofen can be prescribed to be taken with food or milk.

StorageStore at room temperature of 25°C (77°F). Protect from light; avoid excessive heat and humidity.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to ketoprofen, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Fibric Acid Derivative Allergy
- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.

- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.

- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs, even at low doses.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of the elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Embryotoxicity was observed in some, but not all, animal studies. Renal insufficiency and pulmonary hypertension have been noted in premature infants (case reports). Accumulation of the active enantiomer of ketoprofen has also been reported in premature neonates with renal insufficiency. Exposure to NSAIDs late in pregnancy may lead to premature closure of the ductus arteriosus and may inhibit uterine contractions.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Gastrointestinal: Dyspepsia (11%)

Hepatic: Liver function test abnormal (≤15%)

1% to 10%:

Cardiovascular: Peripheral edema (2%)

Central nervous system: Headache (3% to 9%), depression, dizziness (>1%), dreams, insomnia, malaise, nervousness, somnolence

Dermatologic: Rash (>1%)

Gastrointestinal: Abdominal pain (3% to 9%), constipation (3% to 9%), diarrhea (3% to 9%), flatulence (3% to 9%), nausea (3% to 9%), gastrointestinal bleeding (>2%), peptic ulcer (>2%), anorexia (>1%), stomatitis (>1%), vomiting (>1%)

Genitourinary: Urinary tract irritation (>1%)

Ocular: Visual disturbances (>1%)

Otic: Tinnitus (>1%)

Renal: Renal dysfunction (3% to 9%)

<1%, postmarketing, and/or case reports (Limited to important or life-threatening): Agranulocytosis, allergic reaction, allergic rhinitis, alopecia, anaphylaxis, anemia, angioedema, arrhythmia, aseptic meningitis, blurred vision, bone marrow suppression, bronchospasm, buccal necrosis, bullous rash, chills, cholestatic hepatitis, confusion, CHF, conjunctivitis, cystitis, diabetes mellitus (aggravated), drowsiness, dysphoria, dyspnea, eczema, edema, epistaxis, erythema multiforme, exfoliative dermatitis, facial edema, fecal occult blood, fluid retention, gastritis, gastrointestinal perforation, GI ulceration, gynecomastia, hallucinations, hearing decreased, hematemesis, hematuria, hemolytic anemia, hemoptysis, hepatic dysfunction, hepatitis, hot flashes, hypertension, hyponatremia, impotence, infection, interstitial nephritis, intestinal ulceration, jaundice, laryngeal edema, leukopenia, libido disturbance, melena, microvesicular steatosis, migraine, myocardial infarction, nephrotic syndrome, onycholysis, palpitation, pancreatitis, peptic ulcer, peripheral neuropathy, peripheral vascular disease, photosensitivity, polydipsia, polyuria, pruritus, purpura, purpuric rash, renal failure, renal papillary necrosis, retinal hemorrhage, septicemia, shock, Stevens-Johnson syndrome, tachycardia, thrombocytopenia, toxic amblyopia, toxic epidermal necrolysis, tubulopathy, ulcerative colitis, urticaria, vasodilation, xerostomia

Metabolism/Transport Effects **Inhibits** CYP2C9 (weak)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Ketoprofen. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of

Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to GI irritation).

Food: Food slows rate of absorption resulting in delayed and reduced peak serum concentrations; total bioavailability is not affected by food.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, and white willow (all have additional antiplatelet activity).

Monitoring ParametersCBC, chemistry profile, occult blood loss, periodic liver function; renal function (urine output, serum BUN, creatinine)

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse or overdose reactions at beginning of therapy and periodically throughout therapy. Schedule ophthalmic evaluations for patients who develop eye complaints during long-term NSAID therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC, chemistry profile, occult blood loss, periodic liver function; renal function (urine output, serum BUN, creatinine)

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets or break capsules. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience drowsiness, dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); fluid retention (weigh yourself weekly and report unusual (3-5 lb/week) weight gain). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; swollen extremities; skin rash or itching; acute fatigue; hearing changes (ringing in ears); jaundice; right upper quadrant tenderness; or flu-like symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, regular release: 50 mg, 75 mg

Capsule, extended release: 200 mg

Generic AvailableYes

ManufacturerWyeth-Ayerst Laboratories

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Ketoprofen CR)

200 mg (30): $84.12

Capsules (Ketoprofen)

50 mg (90): $20.98

75 mg (60): $14.99

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Regular release: <30 minutes

Duration: Regular release: Up to 6 hours

Absorption: Almost complete

Protein binding: >99%, primarily to albumin; Hepatic impairment: Unbound fraction is approximately doubled

Metabolism: Hepatic via glucuronidation; metabolite can be converted back to parent compound; may have enterohepatic recirculation

Bioavailability: ~90%

Half-life elimination:

Regular release: 2-4 hours; Renal impairment: Mild: 3 hours; moderate-to-severe: 5-9 hours

Extended release: ~3-7.5 hours

Time to peak, serum:

Regular release: 0.5-2 hours

Extended release: 6-7 hours

Excretion: Urine (~80%, primarily as glucuronide conjugates)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

According to the FDA, the over-the-counter NSAID ketoprofen should be viewed as having the potential to interfere with the antiplatelet effect of low-dose aspirin until proven otherwise. This statement was provided in the same warning from the FDA that ibuprofen can interfere with the antiplatelet effect of low-dose aspirin (81 mg/day), potentially rendering aspirin less effective when used for cardioprotection and stroke protection. In situations where these drugs could be used concomitantly, the FDA has provided the following information: Patients who use immediate release aspirin (not enteric-coated aspirin) and take single doses of ibuprofen 400 mg, should dose the ibuprofen at least 30 minutes or longer after aspirin ingestion or more than 8 hours before aspirin ingestion to avoid attenuation of aspirin's effect. Similar recommendations may hold for concomitant ketoprofen and aspirin use.

At this time, recommendations about the timing of ibuprofen 400 mg or other NSAIDs (such as ketoprofen) in patients taking enteric-coated low-dose aspirin cannot be made based on available data.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause insomnia, confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A recent meta-analysis (see References) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective), if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function, and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Acular® may be confused with Acthar®, Ocular®

Ketorolac may be confused with Ketalar®

Toradol® may be confused with Foradil®, Inderal®, Tegretol®, Torecan®, traMADol, tromethamine

International issues:

Toradol® may be confused with Theradol® which is a brand name for tramadol in the Netherlands

Pronunciation(KEE toe role ak)

U.S. Brand NamesAcular LS™; Acular®; Acular® PF

Canadian Brand NamesAcular LS™; Acular®; Apo-Ketorolac Injectable®; Apo-Ketorolac®; Ketorolac Tromethamine Injection, USP; Novo-Ketorolac; ratio-Ketorolac; Toradol®; Toradol® IM

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Ophthalmic; Nonsteroidal Anti-inflammatory Drug (NSAID), Oral; Nonsteroidal Anti-inflammatory Drug (NSAID), Parenteral

Use: Labeled Indications

Oral, injection: Short-term (≤5 days) management of moderate-to-severe acute pain requiring analgesia at the opioid level

Ophthalmic: Temporary relief of ocular itching due to seasonal allergic conjunctivitis; postoperative inflammation following cataract extraction; reduction of ocular pain and photophobia following incisional refractive surgery; reduction of ocular pain, burning, and stinging following corneal refractive surgery

Use: DentalOral, injection: Short-term (≤5 days) management of moderate-to-severe acute pain requiring analgesia at the opioid level

Dosing: Adults

Pain management (acute; moderately-severe):Note: The maximum combined duration of treatment (for parenteral and oral) is 5 days; do not increase dose or frequency; supplement with low dose opioids if needed for breakthrough pain. For patients <50 kg and/or ≥65 years of age, see Elderly dosing.

I.M.: 60 mg as a single dose or 30 mg every 6 hours (maximum daily dose: 120 mg)

I.V.: 30 mg as a single dose or 30 mg every 6 hours (maximum daily dose: 120 mg)

Oral: 20 mg, followed by 10 mg every 4-6 hours; do not exceed 40 mg/day; oral dosing is intended to be a continuation of I.M. or I.V. therapy only

Ophthalmic uses:

Seasonal allergic conjunctivitis (relief of ocular itching) (Acular®):*Ophthalmic:* Instill 1 drop (0.25 mg) 4 times/day

Inflammation following cataract extraction (Acular®):*Ophthalmic:* Instill 1 drop (0.25 mg) to affected eye(s) 4 times/day beginning 24 hours after surgery; continue for 2 weeks

Pain and photophobia following incisional refractive surgery (Acular® PF):*Ophthalmic:* Instill 1 drop (0.25 mg) 4 times/day to affected eye for up to 3 days

Pain following corneal refractive surgery (Acular LS™):*Ophthalmic:* Instill 1 drop 4 times/day as needed to affected eye for up to 4 days

Dosing: ElderlyDosage adjustments in elderly (≥65 years), renal insufficiency, or low body weight (<50 kg): **Note:** These groups have an increased incidence of GI bleeding, ulceration, and perforation. The maximum combined duration of treatment (for parenteral and oral) is 5 days.

I.M.: 30 mg as a single dose or 15 mg every 6 hours (maximum daily dose: 60 mg)

I.V.: 15 mg as a single dose or 15 mg every 6 hours (maximum daily dose: 60 mg)

Oral: 10 mg, followed by 10 mg every 4-6 hours; do not exceed 40 mg/day; oral dosing is intended to be a continuation of I.M. or I.V. therapy only

Dosing: Pediatric

Pain management (acute; moderately-severe):

Children 2-16 years (unlabeled use): Limited pediatric studies. The maximum combined duration of treatment (for parenteral and oral) is 5 days. **Do not exceed adult doses.Note:** The manufacturer warns that oral ketorolac is not indicated for children.

I.V.: Initial dose: 0.5 mg/kg followed by 0.25-1 mg/kg every 6 hours for up to 48 hours; maximum daily dose: 90 mg

Oral: 0.25 mg/kg every 6 hours

Children ≥16 years and <50 kg: *I.V.:* Refer to elderly dosing.

Children ≥16 years and ≥50 kg: *I.V.:* Refer to adult dosing.

Children ≥17 years and <50 kg: *Oral:* Refer to elderly dosing.

Children ≥17 years and ≥50 kg: *Oral:* Refer to adult dosing.

Ophthalmic uses: Children ≥3 years: Refer to adult dosing.

Dosing: Renal ImpairmentContraindicated in patients with advanced renal impairment. Patients with moderately-elevated serum creatinine should use half the recommended dose, not to exceed 60 mg/day I.M./I.V.

Dosing: Hepatic ImpairmentUse with caution, may cause elevation of liver enzymes; discontinue if clinical signs and symptoms of liver disease develop.

Administration: I.M.Administer slowly and deeply into the muscle. Analgesia begins in 30 minutes and maximum effect within 2 hours.

Administration: I.V.Administer I.V. bolus over a minimum of 15 seconds; onset within 30 minutes; peak analgesia within 2 hours.

Administration: I.V. DetailpH: 6.9-7.9

Administration: OralMay take with food to reduce GI upset.

Administration: OtherOphthalmic solution: Contact lenses should be removed before instillation.

Dietary ConsiderationsAdminister tablet with food or milk to decrease gastrointestinal distress.

Storage

Injection: Store at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light. Injection is clear and has a slight yellow color. Precipitation may occur at relatively low pH values.

Ophthalmic solution: Store at room temperature 15°C to 25°C (59°F to 77°F). Protect from light.

Tablet: Store at room temperature of 15°C to 30°C (59°F to 86°F).

CompatibilityStable in D_5NS, D_5W, LR, NS.

Y-site administration: Compatible: Cisatracurium, dexmedetomidine, fentanyl, hydromorphone, methadone, morphine, remifentanil, sufentanil. **Incompatible:** Azithromycin, fenoldopam.

Compatibility in syringe: Compatible: Diazepam, sufentanil. **Incompatible:** Haloperidol, hydroxyzine, nalbuphine, prochlorperazine edisylate, promethazine, triethylperazine. **Variable (consult detailed reference):** Hydromorphone.

Compatibility when admixed: Incompatible: Hydroxyzine, meperidine, morphine, promethazine.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

Contraindications

Oral, injection: Hypersensitivity to ketorolac, aspirin, other NSAIDs, or any component of the formulation; active or history of peptic ulcer disease; recent or history of GI bleeding or perforation; patients with advanced renal disease or risk of renal failure (due to volume depletion); prophylaxis before major surgery; suspected or confirmed cerebrovascular bleeding; hemorrhagic diathesis, incomplete hemostasis, or high risk of bleeding; concurrent ASA or other NSAIDs; concomitant probenecid or pentoxifylline; epidural or intrathecal administration; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery; labor and delivery; breast-feeding

Ophthalmic: Hypersensitivity to ketorolac or any component of the formulation

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Aspirin/other NSAIDs: See “Concurrent drug therapy issues” below.
- Bleeding/hemostasis: See “Concerns related to adverse effects” below.
- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery/major surgery: See “Disease-related concerns” below.
- Elderly: See “Special populations” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

- Hypersensitivity: See “Concerns related to adverse effects” below.

- Labor and delivery/breast-feeding: See “Special populations” below.

- Low body weight: See “Special populations” below.

- Pediatrics: See “Special populations” below.

- Renal impairment: See “Disease-related concerns” below.

- Systemic preparations: See “Dosage form specific issues” below.

Concerns related to adverse effects:

- Bleeding/hemostasis: **[U.S. Boxed Warning]: May inhibit platelet function; contraindicated in patients with cerebrovascular bleeding (suspected or confirmed), hemorrhagic diathesis, incomplete hemostasis and patients at high risk for bleeding.** Effects on platelet adhesion and aggregation may prolong bleeding time. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.

- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding, ulcers, inflammatory bowel disease), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly, or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Hypersensitivity: Even in patients without prior exposure, hypersensitivity including bronchospasm and anaphylactic shock, may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy. **[U.S. Boxed Warning]: Ketorolac injection is contraindicated in patients with prior hypersensitivity reaction to aspirin or NSAIDs.**

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery/major surgery: **[U.S. Boxed Warning]: Use is contraindicated as prophylactic analgesic before any major surgery and is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery. Wound bleeding and postoperative hematomas have been associated with ketorolac use in the perioperative setting.

- Hepatic impairment: Use with caution in patients with hepatic impairment or a history of liver disease. Closely monitor patients with any abnormal LFT. Rarely, severe hepatic reactions (eg, fulminant hepatitis, hepatic necrosis, liver failure) have occurred with NSAID use; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: **[U.S. Boxed Warning]: Ketorolac is contraindicated in patients with advanced renal impairment and in patients at risk for renal failure due to volume depletion.** NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Use with caution in patients with impaired renal function or history of kidney disease. Dosage adjustment is required in patients with moderate elevation in serum creatinine. Acute renal failure, interstitial nephritis, and nephrotic syndrome have been reported with ketorolac use; papillary necrosis and renal injury have been reported with the use of NSAIDs.

Concurrent drug therapy issues:

- Aspirin/other NSAIDs: **[U.S. Boxed Warning]: Concurrent use of ketorolac with aspirin or other NSAIDs is contraindicated due to the increased risk of adverse reactions.**

Special populations:

- Elderly: **[U.S. Boxed Warning]: Dosage adjustment is required for patients ≥65 years of age.** The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs, even at low doses.

- Labor and delivery/breast-feeding: **[U.S. Boxed Warning]: May inhibit uterine contractions (increasing the risk for uterine hemorrhage) and affect fetal circulation; inhibition of prostaglandin synthesis may adversely affect neonates; use is contraindicated in labor and delivery and breast-feeding women.** Avoid use in late pregnancy.

- Low body weight: **[U.S. Boxed Warning]: Dosage adjustment is required for patients weighing <50 kg (<110 pounds).**

- Pediatrics: **[U.S. Boxed Warning]: Oral ketorolac is not indicated for use in children.** Safety and efficacy for ophthalmic solution have not been established in children <3 years of age.

Dosage form specific issues:

- Ophthalmic solution: May increase bleeding time associated with ocular surgery. Use with caution in patients with known bleeding tendencies or those receiving anticoagulants. Healing time may be slowed or delayed. Corneal thinning, erosion, or ulceration have been reported with topical NSAIDs; discontinue if corneal epithelial breakdown occurs. Use caution with complicated ocular surgery, corneal denervation, corneal epithelial defects, diabetes, rheumatoid arthritis, ocular surface disease, or ocular surgeries repeated within short periods of time; risk of corneal epithelial breakdown may be increased. Use for >24 hours prior to or for >14 days following surgery also increases risk of corneal adverse effects. Do not administer while wearing soft contact lenses.

- Systemic preparations: **[U.S. Boxed Warning]: Oral therapy is only indicated for use as continuation treatment, following parenteral ketorolac and is not indicated for minor or chronic painful conditions. The maximum daily oral dose is 40 mg (adults); doses above 40 mg/day do not improve efficacy but may increase the risk of serious adverse effects. [U.S. Boxed Warning]: Systemic ketorolac is indicated for short term (≤5 days) use in adults for treatment of moderately severe acute pain requiring opioid-level analgesia.** The combined therapy duration (oral and parenteral) should not exceed 5 days. **[U.S. Boxed Warning]: Ketorolac injection is contraindicated for epidural or intrathecal administration.**

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsKetorolac is cleared more slowly in the elderly. It is recommended to use lower doses in the elderly. Elderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute or weight <50 kg. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy Considerations**[U.S. Boxed Warning]: Ketorolac is contraindicated during labor and delivery (may inhibit uterine contractions and adversely affect fetal circulation).** Avoid the use of ketorolac (all dosage forms) during late pregnancy.

LactationEnters breast milk/contraindicated

Breast-Feeding Considerations**[U.S. Boxed Warning]: Inhibition of prostaglandin synthesis may adversely affect neonates; use of systemic ketorolac is contraindicated in breast-feeding women.**

Adverse Reactions

Systemic (frequencies noted for parenteral administration):

>10%:

Central nervous system: Headache (17%)

Gastrointestinal: Gastrointestinal pain (13%), dyspepsia (12%), nausea (12%)

>1% to 10%:

Cardiovascular: Edema (4%), hypertension

Central nervous system: Dizziness (7%), drowsiness (6%)

Dermatologic: Pruritus, purpura, rash

Gastrointestinal: Diarrhea (7%), constipation, flatulence, GI bleeding, GI fullness, GI perforation, GI ulcer, heartburn, stomatitis, vomiting

Hematologic: Anemia, bleeding time increased

Hepatic: Liver enzymes increased

Local: Injection site pain (2%)

Otic: Tinnitus

Renal: Renal function abnormal

Miscellaneous: Diaphoresis

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abnormal thinking, acute pancreatitis, acute renal failure, agranulocytosis, alopecia, anaphylactoid reaction, anaphylaxis, angioedema, anxiety, aplastic anemia, arrhythmia, aseptic meningitis, asthma, azotemia, blurred vision, bradycardia, bronchospasm, bruising, chest pain, CHF, cholestatic jaundice, coma, confusion, conjunctivitis, cough, cystitis, depression, dyspnea, dysuria, eosinophilia, epistaxis, eructation, erythema multiforme, esophagitis, euphoria, excessive thirst, exfoliative dermatitis, extrapyramidal symptoms, fever, flank pain, flushing, gastritis, GI hemorrhage, glossitis, hallucinations, hearing loss, hematemesis, hematuria, hemolytic anemia, hemolytic uremic syndrome, hepatitis, hyperglycemia, hyperkalemia, hyperkinesis, hypersensitivity reactions, hyponatremia, hypotension, inability to concentrate, infection, infertility, inflammatory bowel disease exacerbation, insomnia, interstitial nephritis, jaundice, laryngeal edema, leukopenia, liver failure, Lyell's syndrome, lymphadenopathy, maculopapular rash, melena, MI, nephritis, nervousness, oliguria, pallor, palpitation, pancytopenia, paresthesia, photosensitivity, pneumonia, polyuria, proteinuria, psychosis, pulmonary edema, rectal bleeding, renal failure, respiratory depression, rhinitis, seizure, sepsis, somnolence, Stevens-Johnson syndrome, stomatitis (ulcerative), stupor, syncope, tachycardia, thrombocytopenia, tongue edema, toxic epidermal necrolysis, tremor, urinary frequency increased, urinary retention, urticaria, vasculitis, vertigo, weakness, weight gain, wound hemorrhage (postoperative), xerostomia

Ophthalmic solution:

>10%: Ocular: Transient burning/stinging (Acular®: 40%; Acular® PF: 20%)

>1% to 10%:

Central nervous system: Headache

Ocular: Conjunctival hyperemia, corneal infiltrates, iritis, ocular edema, ocular inflammation, ocular irritation, ocular pain, superficial keratitis, superficial ocular infection

Miscellaneous: Allergic reactions

≤1%: Dry eyes, corneal ulcer, blurred vision

Postmarketing and/or case reports: Corneal erosion, corneal perforation, corneal thinning, epithelial breakdown

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Anticonvulsants: Ketorolac may diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Aspirin: Ketorolac may enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Latanoprost: NSAID (Ophthalmic) may diminish the therapeutic effect of Latanoprost. *Risk C: Monitor therapy*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Ketorolac may enhance the adverse/toxic effect of Neuromuscular-Blocking Agents (Nondepolarizing). Specifically, episodes of apnea have been reported in patients using this combination. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: Ketorolac may enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Pentoxifylline: Ketorolac may enhance the adverse/toxic effect of Pentoxifylline. Specifically, the risk of bleeding may be increased with this combination. *Risk X: Avoid combination*

Probenecid: May increase the serum concentration of Ketorolac. *Risk X: Avoid combination*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Oral: High-fat meals may delay time to peak (by ~1 hour) and decrease peak concentrations.

Herb/Nutraceuticals: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, and white willow (all have additional antiplatelet activity).

Monitoring ParametersMonitor response (pain, range of motion, grip strength, mobility, ADL function), inflammation; observe for weight gain, edema; monitor renal function (serum creatinine, BUN, urine output); observe for bleeding, bruising; evaluate gastrointestinal effects (abdominal pain, bleeding, dyspepsia); mental confusion, disorientation, CBC and platelets, liver function tests

Reference RangeSerum concentration: Therapeutic: 0.3-5 mcg/mL; Toxic: >5 mcg/mL

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess allergy history prior to beginning therapy. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. **I.V./I.M.:** Vital signs should be monitored on a regular basis during infusion or following injection. **Oral:** Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse response on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsCBC and platelets, liver function, platelets; renal function (serum creatinine, BUN, urine output)

Patient EducationDo not take any new medication during therapy without consulting prescriber (especially aspirin-containing products or any other NSAIDs). Use exactly as directed; do not increase dose or frequency. Adverse reactions can occur with overuse. Oral doses may be taken with food or milk. Avoid alcohol. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause nausea or vomiting (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help). Report blood in vomitus or stool or other signs of unusual bleeding; abdominal pain; weakness; slurring of speech; ringing in ears; unresolved nausea or vomiting; respiratory difficulty or shortness of breath; skin rash; unusual swelling of extremities; unexplained weight gain; chest pain; or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary. Consult prescriber if breast-feeding.

Ophthalmic: Instill drops as often as recommended. Wash hands before instilling. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of solution. Close eye and roll eye in all directions. Apply gentle pressure to inner corner of eye for 1-2 minutes after instillation. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Temporary stinging or blurred vision may occur. Do not wear soft contact lenses. Report persistent pain, burning, double vision, swelling, itching, or worsening of condition.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as tromethamine: 15 mg/mL (1 mL); 30 mg/mL (1 mL, 2 mL, 10 mL) [contains ethanol]

Solution, ophthalmic, as tromethamine:

Acular®: 0.5% (3 mL, 5 mL, 10 mL) [contains benzalkonium chloride]

Acular LS™: 0.4% (5 mL) [contains benzalkonium chloride]

Solution, ophthalmic, as tromethamine [preservative free]:

Acular® P.F.: 0.5% (0.4 mL)

Tablet, as tromethamine: 10 mg

Generic AvailableYes: Injection, tablet

Pricing: U.S. (www.drugstore.com)

Solution (Acular)

0.5% (3): $59.34

0.5% (5): $99.60

0.5% (10): $185.45

Solution (Acular LS)

0.4% (5): $102.79

Solution (Acular PF)

0.5% (12): $80.13

Tablets (Ketorolac Tromethamine)

10 mg (30): $24.99

Tablets (Toradol Oral)

10 mg (30): $41.99

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Analgesic: I.M.: ~10 minutes

Peak effect: Analgesic: 2-3 hours

Duration: Analgesic: 6-8 hours

Absorption: Oral: Well absorbed (100%)

Distribution: ~13 L; poor penetration into CSF; crosses placenta

Protein binding: 99%

Metabolism: Hepatic

Half-life elimination: 2-6 hours; prolonged 30% to 50% in elderly; up to 19 hours in renal impairment

Time to peak, serum: I.M.: 30-60 minutes

Excretion: Urine (92%, ~60% as unchanged drug); feces ~6%

Related Information

- Nonsteroidal Anti-inflammatory Agents

Pharmacotherapy PearlsFirst parenteral NSAID for analgesia; 30 mg provides the analgesia comparable to 12 mg of morphine or 100 mg of meperidine.

Dental Health Professional ConsiderationsAccording to the manufacturer, ketorolac has been used inappropriately by physicians in the past. The drug had been prescribed to NSAID-sensitive patients, patients with GI bleeding, and for long-term use; a warning has been issued regarding increased incidence and severity of GI complications with increasing doses and duration of use. Labeling now includes the statement that ketorolac inhibits platelet function and is indicated for up to 5 days use only.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and stomatitis.

NSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®). See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness; may rarely produce depression

Mental Health: Effects on Psychiatric TreatmentMay decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 chronic heart failure guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective), if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) recommend that ketorolac therapy be limited to a maximum of 5 days with close attention to gastrointestinal and renal function. The risk of developing renal dysfunction or gastrointestinal bleeding further increases as treatment extends beyond 5 days.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Ketorolac is contraindicated during labor and delivery (may inhibit uterine contractions and adversely affect fetal circulation). Avoid use of ketorolac ophthalmic solution during late pregnancy.

Index TermsKetorolac Tromethamine

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ketotifen may be confused with ketoprofen

Pronunciation(kee toe TYE fen)

U.S. Brand NamesAlaway™ [OTC]; Zaditor® [OTC]

Canadian Brand NamesNovo-Ketotifen®; Nu-Ketotifen®; Zaditen®; Zaditor®

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation; Mast Cell Stabilizer

Use: Labeled Indications

Ophthalmic: Temporary prevention of eye itching due to allergic conjunctivitis

Oral (Canadian use; not approved in U.S.): Adjunctive therapy in the chronic treatment of pediatric patients ≥6 months of age with mild, atopic asthma

Dosing: Adults**Allergic conjunctivitis:** Ophthalmic: Instill 1 drop into the affected eye(s) twice daily, every 8-12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Allergic conjunctivitis: Children ≥3 years: Ophthalmic: Refer to adult dosing.

Atopic asthma (**Note:** Not for acute attacks): Oral (not approved in U.S.):

Children 6 months to 3 years: Initial: 0.025 mg/kg once daily or in 2 divided doses for 5 days; Maintenance: 0.05 mg/kg twice daily

Children >3 years: Initial: 0.5 mg once daily or in 2 divided doses for 5 days; Maintenance: 1 mg twice daily

Administration: OralMay administer without regard to meals.

Dietary ConsiderationsNovo-Ketotifen® syrup contains carbohydrate 4 g/5 mL.

Storage

Ophthalmic solution: Store at 25°C (77°F).

Syrup: Store at up to 25°C (up to 77°F).

Tablet: Store at 15°C to 25°C (59°F to 77°F).

RestrictionsOral formulation not available in U.S.

ContraindicationsHypersensitivity to ketotifen or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Sedation (oral use): May cause drowsiness early in therapy; initiate therapy at one-half the recommended daily dose and gradually increase over 5 days to maintenance dose; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Thrombocytopenia: Rare cases of thrombocytopenia have been reported in patients concurrently using oral ketotifen and oral antidiabetic agents.

Concurrent drug therapy issues:

- Antiasthmatic agents: Oral ketotifen should not be used to treat acute asthma attacks. Therapy with agents used for prophylaxis or relief of asthma related symptoms (eg, corticosteroids, $beta_2$-agonists, xanthine derivatives), should be not be interrupted nor should dosing be immediately reduced with the onset of ketotifen therapy. Reduce dosing gradually especially in patients taking corticosteroids or ACTH therapy. Steroid-dependent patients with adrenocortical insufficiency can take up to one year to recover a normal stress related pituitary-adrenal response.

Special populations:

- Contact lens wearers: Ophthalmic solution: Not to treat contact lens-related irritation. After ketotifen use, soft contact lens wearers should wait at least 10 minutes before putting their lenses in. Do not wear contact lenses if eyes are red. Do not contaminate dropper tip or solution when placing drops in eyes.
- Diabetics: Due to the carbohydrate content of the syrup preparation, diabetic patients may need to use alternative dosage form (tablet)

- Pediatrics: Safety and efficacy have not been established in children <3 years of age and of oral preparation in patients <6 months of age have not been established.

Dosage form specific issues:

- Benzoate allergy: Syrup products may contain benzoate compounds.

Other warnings/precautions:

- Delayed clinical response: Therapeutic effects may not be clinically evident until several weeks after the initiation of therapy while full effectiveness is usually not evident until after 10 weeks of therapy. Patients with an inadequate response after a few weeks should be maintained for at least 2-3 months on therapy. Discontinuation of therapy if needed should occur gradually over 2-4 weeks however symptoms of asthma may reoccur with discontinuation.

Geriatric ConsiderationsInstruct the patient on proper instillation of ophthalmic solution.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse fetal effects were found in some but not all animal studies. Topical ocular administration has not been studied.

LactationEnters breast milk/not recommended

Adverse Reactions

Ophthalmic: 1% to 10%:

Ocular: Allergic reactions, burning or stinging, conjunctivitis, discharge, dry eyes, eye pain, eyelid disorder, itching, keratitis, lacrimation disorder, mydriasis, photophobia, rash

Respiratory: Pharyngitis

Miscellaneous: Flu syndrome

Oral:

1% to 10%:

Central nervous system: Sedation (8%; less than placebo), headache (1%), sleep disturbance (1%)

Dermatologic: Rash (4%), urticaria (1%)

Gastrointestinal: Weight gain (5%), abdominal pain (1%), appetite increased (1%)

Respiratory: Respiratory infection (4%), epistaxis (1%)

Miscellaneous: Flu (3%), puffy eyelid (1%)

<1%, postmarketing, and/or case reports: Cystitis, dizziness, erythema multiforme, excitation, insomnia, irritability, nervousness, Stevens-Johnson syndrome, thrombocytopenia, transaminases increased, xerostomia

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Effects may be increased with concomitant use of ketotifen.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects. Teach patient proper use, side effects/appropriate interventions, and symptoms to report. Taper dosage slowly when discontinuing. Do not discontinue abruptly.

Patient Education

Ophthalmic use: For use in eyes only. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Not to be used to treat contact lens-related irritation. Wait at least 10 minutes before putting soft contact lenses in. Do not wear contact lenses if eyes are red.

Oral: Do not use to treat acute asthmatic attacks. Therapeutic effects may not be clinically evident until several weeks after the initiation of therapy. Do not discontinue abruptly. You may experience drowsiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known).

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant or breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] =

Canadian brand name

Solution, ophthalmic [drops]: 0.025% (5 mL)

Alaway™: 0.025% (10 mL) [contains benzalkonium chloride]

Zaditor®: 0.025% (5 mL) [contains benzalkonium chloride]

Syrup: 1 mg/5 mL (250 mL) [not available in U.S.]

Novo-Ketotifen® [CAN]: 1 mg/5 mL (250 mL) [not available in U.S.; contains alcohol, benzoate compounds; strawberry flavor]

Nu-Ketotifen® [CAN]: 1 mg/5 mL (250 mL) [not available in U.S.]

Zaditen® [CAN]: 1 mg/5 mL (250 mL) [not available in U.S.]

Tablet: 1 mg [not available in U.S.]

Novo-Ketotifen® [CAN]: 1 mg [not available in U.S.]

Zaditen® [CAN]: 1 mg [not available in U.S.]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Zaditor)

0.025% (5): $69.99

Mechanism of ActionExhibits noncompetitive H_1-receptor antagonist and mast cell stabilizer properties. Efficacy in conjunctivitis and asthma likely results from a combination of anti-inflammatory and antihistaminergic actions including interference with chemokine-induced migration of eosinophils into inflamed conjunctiva and airways, inhibition of airway hyper-reactivity due to platelet activating factor (PAF), antagonism of leukotriene-induced bronchoconstriction.

Pharmacodynamics/Kinetics

Ophthalmic:

Onset of action: Minutes

Duration: 8-12 hours

Absorption: Minimally systemic

Oral:

Absorption: Rapid, ≥60%

Protein binding: 75%

Metabolism: Hepatic via N-glucuronidation to inactive metabolite ketotifen-N-glucoronide; N-demethylation to active metabolite nor-ketotifen; and keto-reduction to hydroxyl derivative

Clearance: Increased in children >3 years; decreased in children ≤3 years

Bioavailability: ~50%

Half-life elimination: ~9-9.5 hours

Time to peak, plasma: 2-4 hours

Excretion: Urine (60% to 70% as metabolites, 1% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pharyngitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause dry eyes which can be exacerbated by anticholinergic agents or psychotropics with significant anticholinergic activity

Index TermsKetotifen Fumarate

Labetalol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Labetalol may be confused with betaxolol, Hexadrol®, lamoTRIgine

Trandate® may be confused with traMADol, Trendar®, Trental®, Tridrate®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

Pronunciation(la BET a lole)

U.S. Brand NamesTrandate®

Canadian Brand NamesApo-Labetalol®; Labetalol Hydrochloride Injection, USP; Normodyne®; Trandate®

Pharmacologic CategoryBeta Blocker With Alpha-Blocking Activity

Use: Labeled IndicationsTreatment of mild-to-severe hypertension; I.V. for severe hypertension (eg, hypertensive emergencies)

Use: Unlabeled/InvestigationalPediatric hypertension

Dosing: Adults

Hypertension: Oral: Initial: 100 mg twice daily, may increase as needed every 2-3 days by 100 mg twice daily (titration increments not to exceed 200 mg twice daily) until desired response is obtained; usual dose: 200-400 mg twice daily; may require up to 2.4 g/day.

Usual dose range (JNC 7): 200-800 mg/day in 2 divided doses

Acute hypertension (hypertensive urgency/emergency):

I.V. bolus: 20 mg I.V. push over 2 minutes, may give 40-80 mg at 10-minute intervals, up to 300 mg total dose

I.V. infusion (acute loading): Initial: 2 mg/minute; titrate to response up to 300 mg total dose. Administration requires the use of an infusion pump.

Note: Although loading infusions are well described in the product labeling, the labeling is silent in specific clinical situations, such as in the patient who has an initial response to labetalol infusions but cannot be converted to an oral route for subsequent dosing. There is limited documentation of prolonged continuous infusions. In rare clinical situations, higher continuous infusion dosages (up to 6 mg/minute) have been used in the critical care setting (eg, aortic dissection). At the other extreme, continuous infusions at relatively low doses (0.03-0.1 mg/minute) have been used in some settings (following loading infusion in patients who are unable to be converted to oral regimens or in some cases as a continuation of outpatient oral regimens). These prolonged infusions should not be confused with loading infusions. Because of wide variation in the use of infusions, an awareness of institutional policies and practices is extremely important. Careful clarification of orders and specific infusion rates/units is required to avoid confusion. Due to the prolonged duration of action, careful monitoring should be extended for the duration of the infusion and for several hours after the infusion. Excessive administration may result in prolonged hypotension and/or bradycardia.

Dosing: ElderlyInitial dose: Refer to adult dosing. Usual maintenance: 100-200 mg twice daily

Dosing: Pediatric**Note:** Due to limited documentation of its use, labetalol should be initiated cautiously in pediatric patients with careful dosage adjustment and blood pressure monitoring.

Hypertension:

Oral: Hypertension (unlabeled use): Initial: 1-3 mg/kg/day, in 2 divided doses; maximum: 10-12 mg/kg/day, up to 1200 mg/day

I.V.: Intermittent bolus doses of 0.3-1 mg/kg/dose have been reported.

Pediatric hypertensive emergencies: Initial continuous infusions of 0.4-1 mg/kg/hour with a maximum of 3 mg/kg/hour have been used; administration requires the use of an infusion pump.

Dosing: Renal ImpairmentNot removed by hemo- or peritoneal dialysis; supplemental dose is not necessary.

Dosing: Hepatic ImpairmentDosage reduction may be necessary.

Administration: I.V.Bolus dose may be administered I.V. push at a rate of 10 mg/minute; may follow with continuous I.V. infusion

Administration: I.V. DetailpH: 3-4

Storage

Tablets: Store tablets at 2°C to 30°C (36°F to 86°F). Protect from light and excessive moisture.

Vials: Store unopened injectable vials at 20°C to 25°C (68°F to 77°F); do not freeze. Protect from light. The solution is clear to slightly yellow.

Parenteral admixture: Stability of parenteral admixture at room temperature (25°C) and refrigeration temperature (4°C): 3 days.

Reconstitution

Standard concentration: 500 mg/250 mL D_5W.

Minimum volume: 250 mL D_5W.

CompatibilityStable in D_5LR, $D_{2.5}{}^1/{}_2NS$, $D_5{}^1/{}_4NS$, $D_5{}^1/{}_3NS$, D_5NS, D_5W, LR, NS, Ringer's; most stable at pH of 2-4. **Incompatible** with sodium bicarbonate 5% and alkaline solutions.

Y-site administration: Compatible: Amikacin, aminophylline, amiodarone, ampicillin, butorphanol, calcium gluconate, cefazolin, ceftazidime, ceftizoxime, chloramphenicol, cimetidine, clindamycin, diltiazem, dobutamine, dopamine, enalaprilat, epinephrine, erythromycin lactobionate, esmolol, famotidine, fentanyl, gatifloxacin, gentamicin, hydromorphone, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, metronidazole, midazolam, milrinone, morphine, nicardipine, nitroglycerin, norepinephrine, oxacillin, penicillin G potassium, piperacillin, potassium chloride, potassium phosphates, propofol, ranitidine, sodium acetate, sodium nitroprusside, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium. **Incompatible:** Amphotericin B cholesteryl sulfate complex, cefoperazone, ceftriaxone, nafcillin, thiopental, warfarin. **Variable (consult detailed reference):** Furosemide, heparin, insulin (regular).

Compatibility when admixed: Incompatible: Sodium bicarbonate.

Extemporaneously PreparedA 40 mg/mL suspension of labetalol hydrochloride can be made by first crushing sixteen 300 mg labetalol hydrochloride tablets into a fine powder. Using equal amounts of Ora-Sweet® and Ora-Plus® as a vehicle, add a small amount to make a paste; add additional amounts of the vehicle to qs to 120 mL. Suspension is stable for 60 days when stored in the refrigerator. Shake well before using.

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 4th ed, Cincinnati, OH: Harvey Whitney Books Co, 2000.

ContraindicationsHypersensitivity to labetalol or any component of the formulation; severe bradycardia; heart block greater than first degree (except in patients with a functioning artificial pacemaker); cardiogenic shock; bronchial asthma; uncompensated cardiac failure; conditions associated with severe and prolonged hypotension

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

- Hepatic injury: Severe hepatic injury including some fatalities have also been rarely reported with use; periodically monitor LFTs with prolonged use.

- Hypotension/syncope: Symptomatic hypotension with or without syncope may occur with labetalol; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Initiation with a low dose and gradual up-titration may help to decrease the occurrence of hypotension or syncope. Patients should be advised to avoid driving or other hazardous tasks during initiation of therapy due to the risk of syncope. Orthostatic hypotension may occur with I.V. administration; patient should remain supine during and for up to 3 hours after I.V. administration

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.

- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.

- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms. May also reduce release of insulin in response to hyperglycemia; dosage of antidiabetic agents may need to be adjusted.

- Heart failure (HF): Use with extreme caution in patients with compensated heart failure and monitor for a worsening of the condition.

- Hepatic impairment: Use with caution in patients with hepatic impairment; bioavailability is increased due to decreased first-pass metabolism.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): May precipitate or aggravate symptoms of arterial insufficiency in patients with PVD and Raynaud's disease; use with caution and monitor for progression of arterial obstruction.

- Pheochromocytoma (untreated): If possible, obtain diagnostic tests for pheochromocytoma prior to use. Labetalol has been shown to be effective in lowering blood pressure and relieving symptoms in patients with pheochromocytoma. However, some patients have experienced paradoxical hypertensive responses; use with caution in patients with pheochromocytoma. Additional alpha-blockade may be required during use of labetalol.

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.
- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur. Avoid concurrent I.V. use of both agents.

Special populations:

- Elderly: Elimination of labetalol is reduced in elderly patients; lower maintenance doses may be required.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.

Geriatric ConsiderationsDue to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults.

Pregnancy Risk FactorC (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy ConsiderationsLabetalol crosses the placenta. Beta-blockers have been associated with persistent bradycardia, hypotension, and IUGR; IUGR is probably related to maternal hypertension. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7). Cases of neonatal hypoglycemia have been reported following maternal use of beta-blockers at parturition or during breast-feeding. Monitor breast-fed infant for symptoms of beta-blockade.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsAvailable evidence suggests safe use during breast-feeding. Monitor breast-fed infant for symptoms of beta-blockade.

Adverse Reactions

>10%:

Cardiovascular: Postural hypotension (I.V. use; ≤58%)

Central nervous system: Dizziness (1% to 20%), fatigue (1% to 11%)

Gastrointestinal: Nausea (≤19%)

1% to 10%:

Cardiovascular: Hypotension (1% to 5%), edema (≤2%), flushing (1%), ventricular arrhythmia (I.V. use; 1%)

Central nervous system: Somnolence (3%), headache (2%), vertigo (1% to 2%)

Dermatologic: Scalp tingling (≤7%), pruritus (1%), rash (1%)

Gastrointestinal: Dyspepsia (≤4%), vomiting (≤3%), taste disturbance (1%)

Genitourinary: Ejaculatory failure (≤5%), impotence (1% to 4%)

Hepatic: Transaminases increased (4%)

Neuromuscular & skeletal: Paresthesia (≤5%), weakness (1%)

Ocular: Vision abnormal (1%)

Renal: BUN increased (≤8%)

Respiratory: Nasal congestion (1% to 6%), dyspnea (2%)

Miscellaneous: Diaphoresis (≤4%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Alopecia (reversible), anaphylactoid reaction, ANA positive, angioedema, bradycardia, bronchospasm, cholestatic jaundice, CHF, diabetes insipidus, heart block, hepatic necrosis, hepatitis, hypersensitivity, Peyronie's disease, Raynaud's syndrome, syncope, systemic lupus erythematosus, toxic myopathy, urinary retention, urticaria

Other adverse reactions noted with beta-adrenergic blocking agents include mental depression, catatonia, disorientation, short-term memory loss, emotional lability, clouded sensorium, intensification of pre-existing AV block, laryngospasm, respiratory distress, agranulocytosis, thrombocytopenic purpura, nonthrombocytopenic purpura, mesenteric artery thrombosis, and ischemic colitis.

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Beta2-Agonists: Alpha-/Beta-Blockers may diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Alpha-/Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Labetalol serum concentrations may be increased if taken with food.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid natural licorice (causes sodium and water retention and increases potassium loss). Avoid garlic (may have increased antihypertensive effect).

Test InteractionsFalse-positive urine catecholamines, vanillylmandelic acid (VMA) if measured by fluorometric or photometric methods; use HPLC or specific catecholamine radioenzymatic technique; false-positive amphetamine if measured by thin-layer chromatography or radioenzymatic assay (gas chromatographic-mass spectrometer technique should be used)

Monitoring ParametersBlood pressure, standing and sitting/supine, pulse, cardiac monitor and blood pressure monitor required for I.V. administration

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially anything that will effect blood pressure). Blood pressure and heart rate should be assessed prior to and following first dose and any change in dosage. Caution patients with diabetes to monitor glucose levels closely; beta-blockers may alter glucose tolerance. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, CHF). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, with meals. Do not skip dose or discontinue without consulting prescriber. This medication does not replace other antihypertensive interventions; follow prescriber's instructions for diet and lifestyle changes. If you have diabetes, monitor serum glucose closely and notify prescriber of changes (this medication can alter glycemic response). You may experience drowsiness, dizziness, or impaired judgment (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from sitting or lying position or when climbing stairs); dry mouth, nausea, or loss of appetite (frequent mouth care or sucking lozenges may help); or sexual dysfunction (reversible, may resolve with continued use). Report altered CNS status (eg, fatigue, depression, numbness or tingling of fingers, toes, or skin); palpitations or slowed heartbeat; respiratory difficulty; edema or cold extremities; or other persistent side effects.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 5 mg/mL (4 mL, 8 mL, 20 mL, 40 mL)

Trandate®: 5 mg/mL (20 mL, 40 mL) [contains edetate disodium]

Tablet, as hydrochloride: 100 mg, 200 mg, 300 mg

Trandate®: 100 mg, 200 mg [contains sodium benzoate], 300 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Labetalol HCl)

100 mg (60): $20.99

200 mg (60): $28.99

300 mg (60): $38.99

Tablets (Trandate)

200 mg (60): $50.99

Mechanism of ActionBlocks alpha-, beta$_1$-, and beta$_2$-adrenergic receptor sites; elevated renins are reduced. The ratios of alpha- to beta-blockade differ depending on the route of administration: 1:3 (oral) and 1:7 (I.V.).

Pharmacodynamics/Kinetics

Onset of action: Oral: 20 minutes to 2 hours; I.V.: 2-5 minutes

Peak effect: Oral: 1-4 hours; I.V.: 5-15 minutes

Duration: Blood pressure response:

Oral: 8-12 hours (dose dependent)

I.V.: 2-18 hours (dose dependent; based on single and multiple sequential doses of 0.25-0.5 mg/kg with cumulative dosing up to 3.25 mg/kg)

Distribution: V$_d$: Adults: 3-16 L/kg; mean: <9.4 L/kg; moderately lipid soluble, therefore, can enter CNS; crosses placenta; small amounts enter breast milk

Protein binding: 50%

Metabolism: Hepatic, primarily via glucuronide conjugation; extensive first-pass effect

Bioavailability: Oral: 25%; increased with liver disease, elderly, and concurrent cimetidine

Half-life elimination: Oral: 6-8 hours; I.V.: ~5.5 hours

Excretion: Urine (55% to 60% as glucuronide conjugates, <5% as unchanged drug)

Clearance: Possibly decreased in neonates/infants

Related Information

- Beta-Blockers
- Hypertension

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste disorder.

Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine has interacted with nonselective beta-blockers to result in initial hypertensive episode followed by bradycardia

Mental Health: Effects on Mental StatusDizziness is common; may cause sedation

Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease effects of beta-blockers; low potency antipsychotic and TCAs may potentiate the hypotensive effects of beta-blockers

Cardiovascular Considerations

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, postmyocardial infarction, high coronary disease risk, or diabetes. In type 2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other ConsiderationsDue to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response in the elderly than seen in younger adults. Despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (eg, exercise).

Index TermsIbidomide Hydrochloride; Labetalol Hydrochloride

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - February 2008

The U.S. Food and Drug Administration (FDA) is informing healthcare professionals of an increased risk of suicidality (suicidal behavior or ideation) observed from analysis of clinical studies using various antiepileptic medications compared to placebo. The analysis was performed on 199 placebo-controlled studies involving 43,892 patients (27,863 treated patients versus 16,029 placebo patients) aged ≥5 years receiving one of the following 11 drugs: carbamazepine (Carbatrol®, Equetro®, Tegretol®, Tegretol® XR), felbamate (Felbatol®), gabapentin (Neurontin®), lamotrigine (Lamictal®), levetiracetam (Keppra®), oxcarbazepine (Trileptal®), pregabalin (Lyrica®), tiagabine (Gabitril®), topiramate (Topamax®), valproate (Depakote®, Depakote® ER, Depakene®, Depacon®), and zonisamide (Zonegran®). Studies examined medication efficacy in a variety of disorders, including epilepsy, psychiatric disorders (eg, depression, bipolar disorder), and other conditions (eg, migraine, neuropathic pain). According to the FDA, the results revealed a statistically significant increased risk of suicidality in 0.43% treated patients compared to 0.22% placebo patients, or an estimated 2.1 per 1000 (95% CI: 0.7, 4.2) more patients in the treated groups relative to placebo. This increased risk was reported anywhere from 1 week of therapy through 24 weeks. However, most trials were ≤24 weeks duration and the risk of suicide extending beyond 24 weeks is currently unknown. The relative risk of suicidal behavior or ideation in the treated patients was higher for patients with epilepsy (RR=3.6) compared to patients treated for psychiatric (RR=1.6) or other conditions (RR=2.3). Overall, the incidence of suicidal behavior or ideation occurred consistently across all demographic subgroups and with each of the drugs studied. Of note, four patients receiving an antiepileptic committed suicide relative to none in the placebo groups.

Forthcoming product labeling changes are likely to extend to all antiepileptic drugs and not limited to the drugs used in the studies, pending discussions scheduled for the upcoming advisory committee meeting. Healthcare professionals and family members/caregivers are encouraged to monitor patients receiving any antiepileptic medication for signs/symptoms of suicidality (eg, anxiety, depression, behavior changes). Patients should not stop taking their antiepileptic therapy unless advised by a healthcare professional.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

Lacosamide may be confused with zonisamide

Pronunciation(la KOE sa mide)

U.S. Brand NamesVimpat®

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled IndicationsAdjunctive therapy in the treatment of partial-onset seizures

Dosing: Adults**Partial onset seizure:** Oral, I.V.:

Initial: 50 mg twice daily; may be increased at weekly intervals by 100 mg/day

Maintenance dose: 200-400 mg/day

Note: When switching from oral to I.V. formulations, the total daily dose and frequency should be the same; I.V. therapy should only be used temporarily.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAdolescents ≥17 years: Refer to adult dosing.

Dosing: Renal Impairment
Mild-to-moderate renal impairment: No dose adjustment necessary.

Severe renal impairment (Cl_{cr} ≤30 mL/minute): Maximum dose: 300 mg/day.

Hemodialysis: Removed by hemodialysis; after 4-hour HD treatment, a supplemental dose of up to 50% should be considered.

Dosing: Hepatic Impairment
Mild-to-moderate hepatic impairment: Maximum dose: 300 mg/day.

Severe hepatic impairment: Use is not recommended.

Calculations

- Creatinine Clearance: Adults

Administration: I.V.Administer over 30-60 minutes. Twice daily I.V. infusions have been used for up to 5 days.
Administration: I.V. DetailCan be administered without further dilution or may be mixed with compatible diluents (NS, LR, D_5W). Should not be admixed with other solutions. If diluted, stable for ≤24 hours when stored in glass or PVC bags at room temperature. Discard any unused portion.

pH: 3.5-5

Dietary ConsiderationsTablets may be taken with or without food.
Storage

Injection: Store at 20°C to 25°C (68°F to 77°F); excursions permitted between 15°C to 30°C (59°F to 86°F). Stable when mixed with compatible diluents for ≤24 hours in glass or PVC at room temperature of 15°C to 30°C (59°F to 86°F). Any unused portion should be discarded.

Tablets: Store at 20°C to 25°C (68°F to 77°F); excursions permitted between 15°C to 30°C (59°F to 86°F).

ReconstitutionInjection solution: Can be administered without further dilution or may be mixed with compatible diluents (NS, LR, D_5W).
CompatibilityStable in NS, LR, D_5W.
RestrictionsAn FDA-approved medication guide is available. Distribute to each patient to whom this medication is dispensed.
ContraindicationsThere are no contraindications listed in manufacturer's labeling.
Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Lacosamide may prolong PR interval; use caution in patients with conduction problems (eg, first/second degree atrioventricular block and sick sinus syndrome without pacemaker), myocardial ischemia, heart failure, or if concurrent use with other drugs that prolong the PR interval; ECG is recommended prior to initiating therapy and when at steady state.

- CNS effects: Dizziness and ataxia may occur during therapy; patients should be cautioned about performing tasks which require alertness (eg, operating machinery or driving).

- Multiorgan hypersensitivity reactions (drug reaction with eosinophilia and systemic symptoms [DRESS]): Potentially serious (sometimes fatal, possibly delayed) multiorgan hypersensitivity reactions have been reported with some antiepileptic drugs (rare); monitor for signs and symptoms of possible disparate manifestations associated with lymphatic, hepatic, renal, and/or hematologic organ systems; gradual discontinuation and conversion to alternate therapy may be required.

- Suicidal ideation: Monitor all patients for notable changes in behavior that might indicate suicidal thoughts or depression.

Disease-related concerns:

- Hepatic impairment: Not recommended for use in patients with severe hepatic impairment; dose limitation for mild to moderate hepatic impairment.

- Renal impairment: Use caution in patients with renal impairment; dose limitation and supplementation for severe renal impairment (Cl_{cr} ≤30 mL/minute) and hemodialysis, respectively.

Concurrent drug therapy issues:

- Ethanol: Avoid ethanol (may increase CNS depression).

Special populations:

- Pediatrics: Safety and effectiveness have not been established in patients <17 years of age.

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually (≥1 week) to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Pregnancy Risk FactorC
Pregnancy ConsiderationsDevelopmental toxicities were observed in animal studies. There are no adequate and well-controlled studies in pregnant women; only use during pregnancy if potential benefit justifies the potential risk to the fetus. Two registries are available for women exposed to lacosamide during pregnancy:

Antiepileptic Drug Pregnancy Registry (888-233-2334 or http://www.aedpregnancyregistry.org)

Vimpat® pregnancy registry (888-537-7734)

Lactation Excretion in breast milk unknown/use caution

Breast-Feeding Considerations It is unknown if lacosamide is excreted in human milk. Use during lactation only if the potential benefits to the mother outweigh the potential risks to the infant.

Adverse Reactions

>10%:

Central nervous system: Dizziness (31%), headache (13%)

Gastrointestinal: Nausea (11%)

Ocular: Diplopia (11%)

1% to 10%:

Cardiovascular: Syncope (1%; dose-related: >400 mg/day)

Central nervous system: Fatigue (9%), ataxia (8%), somnolence (7%), coordination impaired (4%), vertigo (4%), depression (2%), memory impairment (2%)

Dermatologic: Pruritus (2%)

Gastrointestinal: Vomiting (9%), diarrhea (4%)

Local: Contusion (3%), skin laceration (3%), injection site pain/discomfort (2.5%), irritation (1%)

Neuromuscular & skeletal: Tremor (7%), weakness (2%)

Ocular: Blurred vision (8%), nystagmus (5%)

<1%, postmarketing, and/or case reports: ALT increased, anemia, atrial fibrillation/flutter, atrioventricular block, attention disturbance, bradycardia, cerebellar syndrome, cognitive dysfunction, confusion, constipation, depression, dysarthria, dyspepsia, erythema (injection site), falling, fever, hepatitis, hypoesthesia (including oral), inebriation-like feeling, irritability, mood changes, multiorgan hypersensitivity, muscle spasm, nephritis, neutropenia, palpitation, paresthesia, tinnitus, xerostomia

Drug Interactions

CarBAMazepine: May decrease the serum concentration of Lacosamide. *Risk C: Monitor therapy*

PHENobarbital: May decrease the serum concentration of Lacosamide. *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of Lacosamide. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Ethanol: Avoid ethanol (may increase CNS depression).

Monitoring Parameters Patients with conduction problems or severe cardiac disease should have ECG tracing prior to start of therapy and when at steady-state

Monitoring: Lab Tests ECG

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Vimpat®: 200 mg/20 mL

Tablet:

Vimpat®: 50 mg, 100 mg, 150 mg, 200 mg

Generic Available No

Manufacturer UCB Pharmaceuticals, Inc

Mechanism of Action *In vitro* studies have shown that lacosamide stabilizes hyperexcitable neuronal membranes and inhibits repetitive neuronal firing by enhancing the slow inactivation of sodium channels (with no effects on fast inactivation of sodium channels).

Pharmacodynamics/Kinetics

Absorption: Oral: Completely

Distribution: V_d: ~0.6 L/kg

Protein binding: <15%

Metabolism: Hepatic; forms metabolite, O-desmethyl-lacosamide (inactive)

Bioavailability: ~100%

Half-life elimination: 13 hours

Time to peak, plasma: Oral: 1-4 hours postdose

Excretion: Urine (95%; 40% as unchanged drug, 30% as inactive metabolite, 20% as uncharacterized metabolite); feces (<0.5%)

Related Information

- Anticonvulsant Drugs of Choice

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsLacosamide may prolong PR interval resulting in cardiac conduction problems; it is not known what effect vasoconstrictors will have in patients taking medications that could prolong PR interval. It is suggested that the clinician consult with the physician prior to use of vasoconstrictor in suspected patients; use vasoconstrictor with caution.

Mental Health: Effects on Mental StatusMay cause suicidal behavior or ideation, dizziness, fatigue, somnolence, memory impairment, and depression

Mental Health: Effects on Psychiatric TreatmentMay cause GI side effects; concomitant use with lithium, carbamazepine, valproic acid, and SSRIs may produce additive effects

Index TermsADD 234037; Harkoseride; LCM; SPM 927

Administration: Oral

Culturelle®: Capsules may be opened and mixed in a cool beverage or sprinkled onto baby food or applesauce.

Flora-Q™: May be taken with or without food.

Lactinex™: Granules may be added to or administered with cereal, food, or milk.

Megadophilus®, Superdophilus®: Administer on an empty stomach; powder should be mixed in unchilled water.

Dietary ConsiderationsProducts may contain whey, evaporated milk, soy peptone casein and/or beef extract; consult individual product labeling. Lactinex™ contains sodium 5.6 mg/4 tablets

Storage

Bacid®: Store at room temperature.

Flora-Q™: Store at or below room temperature; do not store in bathroom.

Kala®, MoreDophilus®: Refrigeration recommended after opening.

Lactinex™, Dofus: Store in refrigerator.

ContraindicationsHypersensitivity to any component of the formulation

Warnings/Precautions

Other warnings/precautions:

- Appropriate use: *Lactobacillus* species have been studied for various gastrointestinal disorders including diarrhea, inflammatory bowel disease, gastrointestinal infection. Effectiveness may be dependent upon actual species used; studies are ongoing. Currently, there are no FDA-approved disease-prevention or therapeutic indications for these products.

Geriatric ConsiderationsNo specific recommendations due to age; keep in mind that elderly suffer significantly with fluid and electrolyte loss (lethargy, confusion, etc) and diarrhea should be aggressively treated

Adverse ReactionsGastrointestinal: Flatulence

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringTeach patient proper use and adverse symptoms to report (eg, discontinue and notify prescriber if high fever develops).

Patient EducationUse exactly as directed; do not take more than prescribed. Granules in capsules may be added to or taken with cereal, food, milk, fruit juice, or water. You may experience increased flatus while taking this medication. Discontinue and notify prescriber if a high fever develops. Refrigerate Lactinex™ and Bacid®. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder:

Lacto-TriBlend: *L. acidophilus, L. bifidus,* and *L. bulgaricus* 10 billion colony-forming units per ¼ teaspoon (60 g) [milk, soy, and yeast free; rice derived]

Megadophilus®, Superdophilus®: *L. acidophilus* 2 billion units per half-teaspoon (49 g, 70 g, 84 g, 126 g) [available in dairy based or dairy free (garbanzo bean) formulations]

MoreDophilus®: *L. acidophilus* 12.4 billion units per teaspoon (30 g, 120 g) [dairy free, yeast free; soy and carrot derived]

Tablet:

Kala®: *L. acidophilus* 200 million units [dairy free, yeast free; soy based]

Lactinex™: *L. acidophilus* and *L. bulgaricus* 1 million live cells [contains whey, evaporated milk, soy peptone, lactose, and beef extract; contains sodium 5.6 mg/4 tablets]

Tablet, chewable: *L. reuteri* 100 million organisms

Wafer: *L. acidophilus* 90 mg and *L. bifidus* 25 mg (100s) [provides 1 billion organisms/wafer at time of manufacture; milk free]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Granules (Lactinex)

1 g (12): $8.99

Mechanism of ActionHelps re-establish normal intestinal flora; suppresses the growth of potentially pathogenic microorganisms by producing lactic acid which favors the establishment of an aciduric flora.

Pharmacodynamics/Kinetics

Absorption: Oral: None

Distribution: Local, primarily colon

Excretion: Feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand Names Lacteol Fort (MX)

Lactulose

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Lactulose may be confused with lactose

Pronunciation(LAK tyoo lose)

U.S. Brand NamesConstulose; Enulose; Generlac; Kristalose®

Canadian Brand NamesAcilac; Apo-Lactulose®; Laxilose; PMS-Lactulose

Pharmacologic CategoryAmmonium Detoxicant; Laxative, Osmotic

Use: Labeled IndicationsAdjunct in the prevention and treatment of portal-systemic encephalopathy; treatment of chronic constipation

Dosing: Adults

Note: Diarrhea may indicate overdosage and responds to dose reduction.

Acute portal-systemic encephalopathy (PSE):

Oral: 20-30 g (30-45 mL) every 1-2 hours to induce rapid laxation; adjust dosage daily to produce 2-3 soft stools; doses of 30-45 mL may be given hourly to cause rapid laxation, then reduce to recommended dose; usual daily dose: 60-100 g (90-150 mL) daily

Rectal: 200 g (300 mL) diluted with 700 mL of H_2O or NS; administer rectally via rectal balloon catheter and retain 30-60 minutes every 4-6 hours.

Constipation: Oral: 10-20 g/day (15-30 mL/day) increased to 60 mL/day in 1-2 divided doses if necessary

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDiarrhea may indicate overdosage and responds to dose reduction.

Prevention of portal systemic encephalopathy (PSE): Oral:

Infants: 2.5-10 mL/day divided 3-4 times/day; adjust dosage to produce 2-3 stools/day.

Older Children: Daily dose of 40-90 mL divided 3-4 times/day; if initial dose causes diarrhea, then reduce it immediately; adjust dosage to produce 2-3 stools/day.

Constipation: Oral: 5 g/day (7.5 mL) after breakfast

Administration: OralDilute lactulose in water, usually 60-120 mL, prior to administering through a gastric or feeding tube.

Administration: OtherSyrup formulation has been used in preparation of rectal solution.

Dietary ConsiderationsContraindicated in patients on galactose-restricted diet; may be mixed with fruit juice, milk, water, or citrus-flavored carbonated beverages.

StorageKeep solution at room temperature to reduce viscosity. Discard solution if cloudy or very dark.

ContraindicationsHypersensitivity to lactulose or any component of the formulation; galactosemia (or patients requiring a low galactose diet)

Warnings/Precautions

Concerns related to adverse effects:

- Electrolyte imbalance: Monitor periodically for electrolyte imbalance when lactulose is used >6 months or in patients predisposed to electrolyte abnormalities (eg, elderly).

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; solution contains galactose and lactose.

Concurrent drug therapy issues:

- Anti-infectives (oral): Patients receiving lactulose and an oral anti-infective agent should be monitored for possible inadequate response to lactulose.

Geriatric ConsiderationsElderly are more likely to show CNS signs of dehydration and electrolyte loss than younger adults. Therefore, monitor closely for fluid and electrolyte loss with chronic use. Sorbitol is equally effective as a laxative and less expensive. However, sorbitol **cannot be substituted** in the treatment of hepatic encephalopathy.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined: Gastrointestinal: Flatulence, diarrhea (excessive dose), abdominal discomfort, nausea, vomiting, cramping

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersBlood pressure, standing/supine; serum potassium, bowel movement patterns, fluid status, serum ammonia
Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness (soft formed stools or resolution of CNS status in PSE), and adverse response (eg, CHF). Monitor frequency/consistency of stools; diarrhea may indicate overdose. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsSerum potassium, serum ammonia
Patient EducationNot for long-term use. Take as directed, alone, or diluted with water, juice or milk, or take with food. Laxative results may not occur for 24-48 hours; do not take more often than recommended or for a longer time than recommended. Do not use any other laxatives while taking lactulose. Increased fiber, fluids, and exercise may also help reduce constipation. Do not use if experiencing abdominal pain, nausea, or vomiting. Diarrhea may indicate overdose. May cause flatulence, belching, or abdominal cramping. Report persistent or severe diarrhea or abdominal cramping. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Crystals for solution, oral:

Kristalose®: 10 g/packet (30s), 20 g/packet (30s)

Solution, oral: 10 g/15 mL (15 mL, 30 mL, 237 mL, 473 mL, 946 mL, 1890 mL)

Constulose: 10 g/15 mL (240 mL, 960 mL)

Enulose: 10 g/15 mL (480 mL)

Generlac: 10 g/15 mL (480 mL, 1920 mL)

Solution, oral/rectal: 10 g/15 mL (473 mL)

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Pack (Kristalose)

10 g (30): $44.50

20 g (30): $65.20

Solution (Enulose)

10 g/15 mL (480): $19.97

Solution (Lactulose)

10 g/15 mL (473): $20.01

Mechanism of ActionThe bacterial degradation of lactulose resulting in an acidic pH inhibits the diffusion of NH_3 into the blood by causing the conversion of NH_3 to NH_4+; also enhances the diffusion of NH_3 from the blood into the gut where conversion to NH_4+ occurs; produces an osmotic effect in the colon with resultant distention promoting peristalsis
Pharmacodynamics/Kinetics

Absorption: Not appreciable

Metabolism: Via colonic flora to lactic acid and acetic acid; requires colonic flora for drug activation

Excretion: Primarily feces and urine (~3%)

Related Information

- Laxatives, Classification and Properties

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentThe therapeutic GI effect of laxation is desired; however, concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive GI side effects

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

LamiVUDine may be confused with lamoTRIgine

Epivir® may be confused with Combivir®

Pronunciation(la MI vyoo deen)

U.S. Brand NamesEpivir-HBV®; Epivir®

Canadian Brand Names3TC®; Heptovir®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled Indications

Epivir®: Treatment of HIV infection when antiretroviral therapy is warranted; should always be used as part of a multidrug regimen (at least three antiretroviral agents)

Epivir-HBV®: Treatment of chronic hepatitis B associated with evidence of hepatitis B viral replication and active liver inflammation

Use: Unlabeled/InvestigationalPostexposure prophylaxis for HIV exposure as part of a multidrug regimen

Dosing: Adults**Note:** The formulation and dosage of Epivir-HBV® are not appropriate for patients infected with both HBV and HIV.

HIV: Oral (use with at least two other antiretroviral agents): 150 mg twice daily **or** 300 mg once daily

<50 kg: 4 mg/kg twice daily (maximum: 150 mg twice daily)

Postexposure prophylaxis for HIV exposure: Oral: 150 mg twice daily (with zidovudine with or without a protease inhibitor, depending on risk)

Prevention of maternal-fetal HIV transmission (AIDSinfo guidelines):Note: Lamivudine may be used in combination with zidovudine and nevirapine in select situations (eg, infants born to mothers with suboptimal viral suppression at delivery, infants born to mothers with only intrapartum therapy or no therapy, or infants born to mothers with known antiretroviral drug-resistant virus). Lamivudine is used in this situation to reduce the development of nevirapine resistant virus:

Mother: 150 mg twice daily starting at onset of labor and continuing through 1 week postpartum

Treatment of hepatitis B (Epivir-HBV®): Oral: 100 mg/day. **Note:** Usual treatment duration is at least 1 year and varies with HBeAg status, consult current guidelines and literature.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** The formulation and dosage of Epivir-HBV® are not appropriate for patients infected with both HBV and HIV.

HIV: Oral (use with at least two other antiretroviral agents)

Neonates <30 days (AIDSinfo guidelines): 2 mg/kg/dose twice daily

Infants 1-3 months (AIDSinfo guidelines): 4 mg/kg/dose twice daily

Infants and Children 3 months to 16 years: 4 mg/kg/dose twice daily (maximum: 150 mg/dose twice daily)

Alternate weight-based dosing using scored 150 mg tablets (AIDSinfo guidelines):

14-21 kg: 75 mg/dose twice daily (150 mg/day)

22-29 kg: 75 mg in the morning, 150 mg in the evening (225 mg/day)

≥30 kg: 150 mg/dose twice daily (300 mg/day)

Children >16 years: Refer to adult dosing.

Prevention of maternal-fetal HIV transmission (AIDSinfo guidelines):Note: Lamivudine may be used in combination with zidovudine and nevirapine in select situations (eg, infants born to mothers with suboptimal viral suppression at delivery, infants born to mothers with only intrapartum therapy or no therapy, or infants born to mothers with known antiretroviral drug-resistant virus). Lamivudine is used in this situation to reduce the development of nevirapine resistant virus:

Neonate: 2 mg/kg/dose twice daily given at birth through 1 week of age

Treatment of hepatitis B: Oral: Children 2-17 years: 3 mg/kg/dose once daily (maximum: 100 mg/day). **Note:** Usual treatment duration is at least 1 year and varies with HBeAg status, consult current guidelines and literature.

Dosing: Renal Impairment

HIV:

Patients ≤16 years: Insufficient data; however, dose reduction should be considered.

Patients >16 years:

Cl_{cr} 30-49 mL/minute: Administer 150 mg once daily

Cl_{cr} 15-29 mL/minute: Administer 150 mg first dose, then 100 mg once daily

Cl_{cr} 5-14 mL/minute: Administer 150 mg first dose, then 50 mg once daily

Cl_{cr} <5 mL/minute: Administer 50 mg first dose, then 25 mg once daily

Treatment of hepatitis B patients: Adults:

Cl_{cr} 30-49 mL/minute: Administer 100 mg first dose, then 50 mg once daily.

Cl_{cr} 15-29 mL/minute: Administer 100 mg first dose, then 25 mg once daily.

Cl_{cr} 5-14 mL/minute: Administer 35 mg first dose, then 15 mg once daily.

Cl_{cr} <5 mL/minute: Administer 35 mg first dose, then 10 mg once daily.

Dialysis: Negligible amounts are removed by 4-hour hemodialysis or peritoneal dialysis. Supplemental dosing is not required.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: Oral May be taken with or without food. Adjust dosage in renal failure.

Dietary Considerations May be taken with or without food. Each 5 mL of oral solution contains 1 g of sucrose.

Storage

Oral solution:

Epivir®: Store at 25°C (77°F) tightly closed.

Epivir-HBV®: Store at 20°C to 25°C (68°F to 77°F) tightly closed.

Tablet: Store at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

Contraindications Hypersensitivity to lamivudine or any component of the formulation

Allergy Considerations

- LamiVUDine Allergy

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Epivir-HBV®: See “Dosage form specific issues” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).
- Pancreatitis: Has been reported, particularly in HIV-infected children with a history of nucleoside use.

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Monitor patients closely for several months following discontinuation of therapy for chronic hepatitis B;** clinical exacerbations may occur. Treatment of HBV in patients with unrecognized/untreated HIV may lead to rapid HIV resistance;

- HIV: Appropriate use: Do not use as monotherapy in treatment of HIV. Treatment of HIV in patients with unrecognized/untreated HBV may lead to rapid HBV resistance.

- Renal impairment: Use with caution in patients with renal impairment; dosage reduction recommended.

Concurrent drug therapy issues:

- Interferon alfa: Use with caution in combination with interferon alfa with or without ribavirin in HIV/HBV coinfected patients; monitor closely for hepatic decompensation, anemia, or neutropenia; dose reduction or discontinuation of interferon and/or ribavirin may be required if toxicity evident.

Special populations:

- Pediatrics: Use with extreme caution in children with history of pancreatitis or risk factors for development of pancreatitis.

Dosage form specific issues:

- Epivir-HBV®: **[U.S. Boxed Warning]: Do not use Epivir-HBV® tablets or Epivir-HBV® oral solution for the treatment of HIV.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsLamivudine crosses the placenta. No increased risk of overall birth defects has been observed following 1st trimester exposure according to data collected by the antiretroviral pregnancy registry. The pharmacokinetics of lamivudine during pregnancy are not significantly altered and dosage adjustment is not required. The Perinatal HIV Guidelines Working Group recommends lamivudine for use during pregnancy; the combination of lamivudine with zidovudine is the recommended dual combination NRTI in pregnancy. It may also be used in combination with zidovudine in HIV-infected women who are in labor, but have had no prior antiretroviral therapy, in order to reduce the maternal-fetal transmission of HIV. Cases of lactic acidosis/hepatic steatosis syndrome have been reported in pregnant women receiving nucleoside analogues. It is not known if pregnancy itself potentiates this known side effect; however, pregnant women may be at increased risk of lactic acidosis and liver damage. Hepatic enzymes and electrolytes should be monitored frequently during the 3rd trimester of pregnancy in women receiving nucleoside analogues. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsReported for treatment of HIV or HBV in adults. Incidence data includes patients on combination therapy with other antiretroviral agents.

>10%:

Central nervous system: Headache (21% to 35%), fatigue (24% to 27%), insomnia (11%)

Gastrointestinal: Nausea (15% to 33%), diarrhea (14% to 18%), pancreatitis (range: 0.3% to 18%; higher percentage in pediatric patients), abdominal pain (9% to 16%), vomiting (13% to 15%)

Hematologic: Neutropenia (7% to 15%)

Hepatic: Transaminases increased (2% to 11%)

Neuromuscular & skeletal: Myalgia (8% to 14%), neuropathy (12%), musculoskeletal pain (12%)

Respiratory: Nasal signs and symptoms (20%), cough (18%), sore throat (13%)

Miscellaneous: Infections (25%; includes ear, nose, and throat)

1% to 10%:

Central nervous system: Dizziness (10%), depression (9%), fever (7% to 10%), chills (7% to 10%)

Dermatologic: Rash (5% to 9%)

Gastrointestinal: Anorexia (10%), lipase increased (10%), abdominal cramps (6%), dyspepsia (5%), amylase increased (<1% to 4%), heartburn

Hematologic: Thrombocytopenia (1% to 4%), hemoglobinemia (2% to 3%)

Neuromuscular & skeletal: Creatine phosphokinase increased (9%), arthralgia (5% to 7%)

<1%, postmarketing, and/or case reports: Alopecia, anaphylaxis, anemia, body fat redistribution, hepatitis B exacerbation, hepatomegaly, hyperbilirubinemia, hyperglycemia, immune reconstitution syndrome, lactic acidosis, lymphadenopathy, muscle weakness, paresthesia, peripheral neuropathy, pruritus, red cell aplasia, rhabdomyolysis, splenomegaly, steatosis, stomatitis, urticaria, weakness, wheezing

Drug Interactions

Emtricitabine: LamiVUDine may enhance the adverse/toxic effect of Emtricitabine. *Risk X: Avoid combination*

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Trimethoprim: May decrease the excretion of LamiVUDine. *Risk C: Monitor therapy*

Zalcitabine: LamiVUDine may diminish the therapeutic effect of Zalcitabine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Food decreases the rate of absorption and C_{max}; however, there is no change in the systemic AUC. Therefore, may be taken with or without food.

Monitoring ParametersAmylase, bilirubin, liver enzymes, hematologic parameters, viral load, and CD4 count; signs and symptoms of pancreatitis

Nursing: Physical Assessment/MonitoringUse caution in presence of impaired hepatic or renal function. Assess potential for interactions with other pharmacological agents patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, nausea/vomiting [dehydration]; peripheral neuropathy; hepatitis B [jaundice, fatigue, anorexia]) on a regular basis throughout therapy. Monitor patients closely for several months following discontinuation of therapy for chronic hepatitis B and clinical exacerbations. Teach patient proper use (eg, timing of multiple medications), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsAmylase, bilirubin, liver enzymes, CBC

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. This is not a cure for HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. This medication may be prescribed with a combination of other medications; time these medications as directed by prescriber. Take with or without food. Do not take antacids within 1 hour of lamivudine. Frequent blood tests may be required with prolonged therapy. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). May cause nausea, vomiting, or abdominal pain (sucking on lozenges, chewing gum, or small, frequent meals may help); diarrhea (boiled milk, buttermilk, or yogurt may help); dizziness or insomnia (use caution when driving or engaging in tasks that require alertness until response to drug is known); or headache, fever, or muscle pain (an analgesic may be recommended). Report persistent lethargy or unusual fatigue, yellowing of eyes, pale stool and dark urine, acute headache, severe nausea or vomiting, respiratory difficulty, loss of sensation, rash, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Epivir®: 10 mg/mL (240 mL) [strawberry-banana flavor]

Epivir-HBV®: 5 mg/mL (240 mL) [strawberry-banana flavor]

Tablet:

Epivir®: 150 mg [scored], 300 mg

Epivir-HBV®: 100 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Solution (Epivir)

10 mg/mL (240): $96.79

Tablets (Epivir)

150 mg (60): $375.34

300 mg (30): $385.88

Tablets (Epivir HBV)

100 mg (60): $678.48

Mechanism of ActionLamivudine is a cytosine analog. After lamivudine is triphosphorylated, the principle mode of action is inhibition of HIV reverse transcription via viral DNA chain termination; inhibits RNA- and DNA-dependent DNA polymerase activities of reverse transcriptase. The monophosphate form of lamivudine is incorporated into the viral DNA by hepatitis B virus polymerase, resulting in DNA chain termination.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: V_d: 1.3 L/kg

Protein binding, plasma: <36%

Metabolism: 4.2% to trans-sulfoxide metabolite

Bioavailability: Absolute; Cp_{max} decreased with food although AUC not significantly affected

Children: 66%

Adults: 86% to 87%

Half-life elimination: Children: 2 hours; Adults: 5-7 hours

Time to peak, plasma: Fed: 3.2 hours; Fasted: 0.9 hours

Excretion: Primarily urine (as unchanged drug)

Related Information

- Antiretroviral Agents

- Management of Healthcare Worker Exposures to HBV, HCV, and HIV
- Perinatal HIV Guidelines

Pharmacotherapy PearlsLamivudine has been well studied in the treatment of chronic hepatitis B infection. Potential compliance problems, frequency of administration, and adverse effects should be discussed with patients before initiating therapy to help prevent the emergence of resistance.

A high rate of early virologic nonresponse was observed when abacavir, lamivudine and tenofovir were used as the initial regimen in treatment-naive patients. A high rate of early virologic nonresponse was also observed when didanosine, lamivudine, and tenofovir were used as the initial regimen in treatment-naive patients. Use of either of these combinations is not recommended; patients currently on either of these regimens should be closely monitored for modification of therapy.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusFatigue and insomnia are common; may cause dizziness or depression
Mental Health: Effects on Psychiatric TreatmentMay rarely cause neutropenia; use caution with clozapine and carbamazepine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

LamoTRIgine may be confused with labetalol, Lamisil®, lamiVUDine, Lomotil®, ludiomil

Lamictal® may be confused with Lamisil®, Lomotil®, ludiomil

Pronunciation(la MOE tri jeen)

U.S. Brand NamesLamictal®

Canadian Brand NamesApo-Lamotrigine®; Gen-Lamotrigine; Lamictal®; Novo-Lamotrigine; PMS-Lamotrigine; ratio-Lamotrigine

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled IndicationsAdjunctive therapy in the treatment of generalized seizures of Lennox-Gastaut syndrome, primary generalized tonic-clonic seizures, and partial seizures in adults and children ≥2 years of age; conversion to monotherapy in adults with partial seizures who are receiving treatment with valproic acid or a single enzyme-inducing antiepileptic drug (specifically carbamazepine, phenytoin, phenobarbital or primidone); maintenance treatment of bipolar I disorder

Dosing: Adults**Note:** Only whole tablets should be used for dosing, round calculated dose down to the nearest whole tablet. Enzyme-inducing regimens specifically refer to those containing carbamazepine, phenytoin, phenobarbital, or primidone. Oral:

Lennox-Gastaut (adjunctive), primary generalized tonic-clonic seizures (adjunctive) or partial seizures (adjunctive): Initial: 25 mg/day for weeks 1 and 2, then increase to 50 mg/day for weeks 3 and 4; maintenance: titrate dose to effect; after week 4 increase daily dose every 1-2 weeks by 50 mg/day; usual maintenance: 225-375 mg/day in 2 divided doses.

Adjustment for AED regimens **containing** valproic acid (see "Note"): Initial: 25 mg every other day for weeks 1 and 2, then increase to 25 mg every day for weeks 3 and 4. Maintenance: Titrate dose to effect; after week 4 increase daily dose every 1-2 weeks by 25-50 mg/day; usual maintenance: 100-400 mg/day in 1 or 2 divided doses.

Note: For patients taking lamotrigine with valproic acid alone, the usual maintenance dose is 100-200 mg/day.

Adjustment for **enzyme-inducing** AED regimens **without** valproic acid: Initial: 50 mg/day for weeks 1 and 2, then increase to 100 mg/day in 2 divided doses for weeks 3 and 4. Maintenance: Titrate dose to effects; after week 4 increase daily dose every 1-2 weeks by 100 mg/day; usual maintenance: 300-500 mg/day in 2 divided doses. Doses as high as 700 mg/day have been used, though additional benefit has not been established.

Conversion to monotherapy with lamotrigine:

Conversion from adjunctive therapy with valproic acid: Initiate and titrate as per recommendations to a lamotrigine dose of 200 mg/day. Then taper valproic acid dose in decrements of not >500 mg/day at intervals of 1 week (or longer) to a valproic acid dosage of 500 mg/day; this dosage should be maintained for 1 week. The lamotrigine dosage should then be increased to 300 mg/day while valproic acid is decreased to 250 mg/day; this dosage should be maintained for 1 week. Valproic acid may then be discontinued, while the lamotrigine dose is increased by 100 mg/day at weekly intervals to achieve a lamotrigine maintenance dose of 500 mg/day.

Conversion from adjunctive therapy with carbamazepine, phenytoin, phenobarbital, or primidone: Initiate and titrate as per recommendations to a lamotrigine dose of 500 mg/day. Concomitant enzyme-inducing AED should then be withdrawn by 20% decrements each week over a 4-week period. Patients should be monitored for rash.

Conversion from adjunctive therapy with AED other than carbamazepine, phenytoin, phenobarbital, primidone or valproic acid: No specific guidelines available.

Bipolar disorder: Initial: 25 mg/day for weeks 1 and 2, then increase to 50 mg/day for weeks 3 and 4, then increase to 100 mg/day for week 5; Maintenance: Increase dose to 200 mg/day beginning week 6.

Adjustment for regimens **containing** valproic acid: Initial: 25 mg every other day for weeks 1 and 2, then increase to 25 mg every day for weeks 3 and 4, then increase to 50 mg/day for week 5. Maintenance: 100 mg/day beginning week 6.

Adjustment for **enzyme-inducing** regimens **without** valproic acid: Initial: 50 mg/day for weeks 1 and 2, then increase to 100 mg/day in divided doses for weeks 3 and 4, then increase to 200 mg/day in divided doses for week 5, then increase to 300 mg/day in divided dose for week 6. Maintenance: 400 mg/day in divided doses beginning week 7.

Adjustment following discontinuation of psychotropic medication:

Discontinuing valproic acid with current dose of lamotrigine 100 mg/day: 150 mg/day for week 1, then increase to 200 mg/day beginning week 2.

Discontinuing carbamazepine, phenytoin, phenobarbital, primidone, or rifampin with current dose of lamotrigine 400 mg/day: 400 mg/day for week 1, then decrease to 300 mg/day for week 2, then decrease to 200 mg/day beginning week 3.

Discontinuing therapy: Decrease dose by ~50% per week, over at least 2 weeks unless safety concerns require a more rapid withdrawal. Discontinuing carbamazepine, phenytoin, phenobarbital, or primidone should prolong the half-life of lamotrigine; discontinuing valproic acid should shorten the half-life of lamotrigine

Restarting therapy after discontinuation: If lamotrigine has been withheld for >5 half-lives, consider restarting according to initial dosing recommendations.

Dosage adjustment with combination hormonal contraceptives: Follow initial dosing guidelines, maintenance dose should be adjusted as follows: Patients taking carbamazepine, phenytoin, phenobarbital, primidone or rifampin: No dosing adjustment required

Patients **not** taking carbamazepine, phenytoin, phenobarbital, primidone or rifampin: Maintenance dose may need increased by twofold over target dose. If already taking a stable dose of lamotrigine and starting contraceptive, maintenance dose may need increased by twofold. Dose increases should start when contraceptive is started and titrated to clinical response increasing no more rapidly than 50-100 mg/day every week. Gradual increases of lamotrigine plasma levels may occur during the inactive “pill-free” week and will be greater when dose increases are made the week before. If increased adverse events consistently occur during “pill-free” week, overall dose adjustments may be required. When discontinuing combination hormonal contraceptive, dose of lamotrigine may need decreased by as much as 50%; do not decrease by more than 25% of total daily dose over a 2-week period unless clinical response or plasma levels indicate otherwise. Dose adjustments during “pill-free” week are not recommended.

⇧ Dosing: ElderlyRefer to adult dosing.

⇧ Dosing: Pediatric**Note:** Only whole tablets should be used for dosing, round calculated dose down to the nearest whole tablet. Enzyme-inducing regimens specifically refer to those containing carbamazepine, phenytoin, phenobarbital, or primidone.

Lennox-Gastaut (adjunctive), primary generalized tonic-clonic seizures (adjunctive), or partial seizures (adjunctive): Oral: **Note:** Children <30 kg will likely require maintenance doses to be increased as much as 50% based on clinical response regardless of regimen below:

Children 2-12 years: Initial: 0.3 mg/kg/day in 1-2 divided doses for weeks 1 and 2, then increase to 0.6 mg/kg/day in 1-2 divided doses for weeks 3 and 4; maintenance: titrate dose to effect; after week 4, increase daily dose every 1-2 weeks by 0.6 mg/kg/day; usual maintenance: 4.5-7.5 mg/kg/day in 2 divided doses; maximum: 300 mg/day in 2 divided doses.

Adjustment for AED regimens **containing** valproic acid (see "Note"): Initial: 0.15 mg/kg/day in 1-2 divided doses for weeks 1 and 2, then increase to 0.3 mg/kg/day in 1-2 divided doses for weeks 3 and 4; maintenance: titrate dose to effect; after week 4, increase daily dose every 1-2 weeks by 0.3 mg/kg/day; usual maintenance: 1-5 mg/kg/day in 2 divided doses; maximum: 200 mg/day in 1-2 divided doses

Note: For patients >6.7 kg and <14 kg, initial dosing should be 2 mg every other day for first 2 weeks, then increased to 2 mg daily for weeks 3-4. For patients taking lamotrigine with valproic acid alone, the usual maintenance dose is 1-3 mg/kg/day in 2 divided doses

Adjustment for **enzyme-inducing** AED regimens **without** valproic acid: Initial: 0.6 mg/kg/day in 2 divided doses for weeks 1 and 2, then increase to 1.2 mg/kg/day in 2 divided doses for weeks 3 and 4; maintenance: titrate dose to effect; after week 4, increase daily dose every 1-2 weeks by 1.2 mg/kg/day; usual maintenance: 5-15 mg/kg/day in 2 divided doses; maximum: 400 mg/day in 2 divided doses

Children >12 years: Refer to adult dosing.

Conversion from single enzyme-inducing AED regimen to monotherapy: Children ≥16 years: Refer to adult dosing.

Discontinuing therapy: Refer to adult dosing.

Restarting therapy after discontinuation: Refer to adult dosing.

Dosage adjustment with combination hormonal contraceptives: Refer to adult dosing.

⇧ Dosing: Renal ImpairmentDecreased dosage may be effective in patients with significant renal impairment; use with caution.

⇧ Dosing: Hepatic Impairment

Moderate-to-severe impairment without ascites: Decrease initial, escalation, and maintenance doses by ~25%

Moderate-to-severe impairment with ascites: Decrease initial, escalation, and maintenance doses by ~50%

Administration: OralDoses should be rounded down to the nearest whole tablet. Dispersible tablets may be chewed, dispersed in water or diluted fruit juice, or swallowed whole. To disperse tablets, add to a small amount of liquid (just enough to cover tablet); let sit ~1 minute until dispersed; swirl solution and consume immediately. Do not administer partial amounts of liquid. If tablets are chewed, a small amount of water or diluted fruit juice should be used to aid in swallowing.

Dietary ConsiderationsTake without regard to meals; drug may cause GI upset.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

Extemporaneously PreparedA 1 mg/mL oral suspension may be compounded as follows: Crush one 100 mg tablet and reduce to a fine powder. Add small amount of Ora-Sweet® or Ora-Plus® and mix to uniform paste. Transfer to graduate and qs to 100 mL. Shake well before using and refrigerate. Suspension is stable for 91 days.

Nahata M, Morosco R, Hipple T. "Stability of Lamotrigine in Two Extemporaneously Prepared Oral Suspensions at 4 and 25°C," *Am J Health Syst Pharm*, 1999, 56:240-2.

ContraindicationsHypersensitivity to lamotrigine or any component of the formulation

Allergy Considerations

- LamoTRIgine Allergy

Warnings/Precautions

Boxed warnings:

- Skin rashes: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Blood dyscrasias: A spectrum of hematologic effects have been reported with use (eg, neutropenia, leukopenia, thrombocytopenia, pancytopenia, and anemias); patients with a previous history of adverse hematologic reaction to any drug may be at increased risk. Early detection of hematologic change is important; advise patients of early signs and symptoms including fever, sore throat, mouth ulcers, infections, easy bruising, petechial or purpuric hemorrhage. May be associated with hypersensitivity syndrome.

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Multiorgan hypersensitivity reactions: Potentially serious, sometimes fatal multiorgan hypersensitivity reactions have been reported with some antiepileptic drugs; monitor for signs and symptoms of possible disparate manifestations associated with lymphatic, hepatic, renal, and/or hematologic organ systems; gradual discontinuation and conversion to alternate therapy may be required.

- Skin rashes: **[U.S. Boxed Warning]: Severe and potentially life-threatening skin rashes requiring hospitalization have been reported; risk may be increased by coadministration with valproic acid, higher than recommended starting doses, and rapid dose titration.** The majority of cases occur in the first 8 weeks; however, isolated cases may occur after prolonged treatment; discontinue at first sign of rash unless rash is clearly not drug related.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with impaired cardiac function.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Hormonal contraceptives: May cause a decrease in lamotrigine levels requiring dose adjustment.

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Other warnings/precautions:

- Bipolar disorder use: Patients treated for bipolar disorder should be monitored closely for clinical worsening or suicidality; prescriptions should be written for the smallest quantity consistent with good patient care.

- Melanin binding: Binds to melanin and may accumulate in the eye and other melanin-rich tissues; the clinical significance of this is not known.

- Monotherapy: Safety and efficacy have not been established for use as initial monotherapy, conversion to monotherapy from antiepileptic drugs (AED) other than carbamazepine, phenytoin, phenobarbital, primidone or valproic acid or conversion to monotherapy from two or more AEDs.

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal. Taper over at least 2 weeks if possible.

Geriatric ConsiderationsNo pharmacokinetic differences noted between young adults and the elderly. Use with caution in the elderly with significant renal decline.

Pregnancy Risk FactorC

Pregnancy ConsiderationsLamotrigine has been found to decrease folate concentrations in animal studies. Teratogenic effects in animals were not observed. Lamotrigine crosses the human placenta and can be measured in the plasma of exposed newborns. Preliminary data from the North American Antiepileptic Drug Pregnancy Registry (NAAED) suggest an increased incidence of cleft lip and/or cleft palate following first trimester exposure. Healthcare providers may enroll patients in the Lamotrigine Pregnancy Registry by calling (800) 336-2176. Patients may enroll themselves in the NAAED registry by calling (888) 233-2334. Dose of lamotrigine may need adjustment during pregnancy to maintain clinical response; lamotrigine serum levels may decrease during pregnancy and return to prepartum levels following delivery. Monitor frequently during pregnancy, following delivery, and when adding or discontinuing combination hormonal contraceptives.

LactationEnters breast milk/not recommended (AAP rates "of concern")

Breast-Feeding ConsiderationsLamotrigine is found in breast milk. In one study, the relative dose to the infant was 9% (range 2% to 20%) of the weight-adjusted maternal dose. Lamotrigine was measurable in the plasma of nursing infants; adverse events were not observed.

Adverse ReactionsPercentages reported in adults on monotherapy for epilepsy or bipolar disorder.

>10%: Gastrointestinal: Nausea (7% to 14%)

1% to 10%:

Cardiovascular: Chest pain (5%), peripheral edema (2% to 5%), edema (1% to 5%)

Central nervous system: Somnolence (9%), fatigue (8%), dizziness (7%), anxiety (5%), insomnia (5% to 10%), pain (5%), ataxia (2% to 5%), irritability (2% to 5%), suicidal ideation (2% to 5%), agitation (1% to 5%), amnesia (1% to 5%), depression (1% to 5%), dream abnormality (1% to 5%), emotional lability (1% to 5%), fever (1% to 5%), hypoesthesia (1% to 5%), migraine (1% to 5%), thought abnormality (1% to 5%), confusion (1%)

Dermatologic: Rash (nonserious: 7%), dermatitis (2% to 5%), dry skin (2% to 5%)

Endocrine & metabolic: Dysmenorrhea (5%), libido increased (2% to 5%)

Gastrointestinal: Vomiting (5% to 9%), dyspepsia (7%), abdominal pain (6%), xerostomia (2% to 6%), constipation (5%), weight loss (5%), anorexia (2% to 5%), peptic ulcer (2% to 5%), rectal hemorrhage (2% to 5%), flatulence (1% to 5%), weight gain (1% to 5%)

Genitourinary: Urinary frequency (1% to 5%)

Neuromuscular & skeletal: Back pain (8%), coordination abnormal (7%), weakness (2% to 5%), arthralgia (1% to 5%), myalgia (1% to 5%), neck pain (1% to 5%), paresthesia (1%)

Ocular: Nystagmus (2% to 5%), vision abnormal (2% to 5%), amblyopia (1%)

Respiratory: Rhinitis (7%), cough (5%), pharyngitis (5%), bronchitis (2% to 5%), dyspnea (2% to 5%), epistaxis (2% to 5%), sinusitis (1% to 5%)

Miscellaneous: Infection (5%), diaphoresis (2% to 5%), reflexes increased/decreased (2% to 5%), dyspraxia (1% to 5%)

<1%: Any indication (limited to important or life-threatening): Accommodation abnormality, acne, alcohol intolerance, allergic reaction, alopecia, anemia, angina, angioedema, aphasia, appetite increased, arthritis, atrial fibrillation, breast pain, bruising, cerebellar syndrome, cerebral sinus thrombosis, cerebrovascular accident, chills, choreoathetosis, CNS depression/stimulation, conjunctivitis, deafness, deep thrombophlebitis, delirium, delusions, dermatitis (exfoliative, fungal), dry eyes, dysphagia, dysphoria, dystonia, ear pain, ECG abnormality, ejaculation abnormal, eructation, euphoria, extrapyramidal syndrome, faintness, flushing, gastritis, gingivitis, goiter, halitosis, hallucinations, hematuria, hemiplegia, hemorrhage, hiccup, hirsutism, hot flashes, hyperalgesia, hyperglycemia, hypertension, hyperventilation, hypokinesia, hypothyroidism, hypotonia, impotence, kidney failure (acute), leg cramps, leukopenia, liver function tests abnormal, maculopapular rash, malaise, menorrhagia, MI, mouth ulceration, movement disorder, muscle spasm, myasthenia, neuralgia, neurosis, palpitation, paralysis, peripheral neuritis, photophobia, polyuria, postural hypotension, salivation increased, skin discoloration, Stevens-Johnson syndrome, suicide, syncope, tachycardia, taste loss/perversion, thrombocytopenia, tinnitus, tongue edema, twitching, urinary incontinence, urticaria, vasodilation, yawn

Also observed: Rash requiring hospitalization: Children <16 years 0.8% (epilepsy adjunctive therapy); Adults 0.3% (epilepsy adjunctive therapy), 0.13% (epilepsy monotherapy), 0.8% (bipolar disorder, monotherapy)

Postmarketing and/or case reports (any indication): Agranulocytosis, aplastic anemia, apnea, disseminated intravascular coagulation, esophagitis, hemolytic anemia, hypersensitivity reactions, lupus-like reaction, multiorgan failure, neutropenia, pancreatitis, pancytopenia, parkinsonian exacerbation, progressive immunosuppression, red cell aplasia, rhabdomyolysis, tic, toxic epidermal necrolysis, vasculitis

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

CarBAMazepine: LamoTRIgine may enhance the adverse/toxic effect of CarBAMazepine. CarBAMazepine may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: LamoTRIgine may enhance the adverse/toxic effect of Desmopressin. LamoTRIgine may enhance the therapeutic effect of Desmopressin. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

OLANZapine: LamoTRIgine may enhance the sedative effect of OLANZapine. *Risk C: Monitor therapy*

Oral Contraceptive (Estrogens): May decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Phenytoin: May increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Primidone: May increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Rifampin: May increase the metabolism of LamoTRIgine. *Risk C: Monitor therapy*

Ritonavir: May decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Valproic Acid: May enhance the adverse/toxic effect of LamoTRIgine. Valproic Acid may increase the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Has no effect on absorption.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased).

Monitoring ParametersSeizure, frequency and duration, serum levels of concurrent anticonvulsants, hypersensitivity reactions, especially rash

Reference RangeA therapeutic serum concentration range has not been established for lamotrigine. Dosing should be based on therapeutic response. Lamotrigine plasma concentrations of 0.25-29.1 mcg/mL have been reported in the literature.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for skin rash. Discontinue at the first sign of rash, unless clearly not drug related. Taper dosage slowly when discontinuing. Observe and teach seizure/safety precautions. Use caution in writing and/or interpreting prescriptions/orders. Confusion between Lamictal® (lamotrigine) and Lamisil® (terbinafine) has occurred. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsSerum levels of concurrent anticonvulsants, LFTs, renal function

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. Only whole tablets should be used for dosing, rounded down to the nearest whole tablet. When having the prescription refilled, contact the prescriber if the medicine looks different or the label name has changed. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, loss of appetite, heartburn, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Women who start or stop oral contraceptives should notify their prescriber. Wear identification of epileptic status and medications. Report CNS changes, mentation changes, suicidal ideation, depression, or changes in cognition; persistent GI symptoms (cramping, constipation, vomiting, anorexia); swelling of face, lips, or tongue; easy bruising or bleeding (mouth, urine, stool); vision changes; worsening of seizure activity, or loss of seizure control. A skin rash may indicate a serious medical problem; contact prescriber immediately if rash noted. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 100 mg, 150 mg, 200 mg

Lamictal®: 25 mg, 100 mg, 150 mg, 200 mg

Tablet, combination package [each unit-dose starter kit contains]:

Lamictal® (blue kit; for patients taking valproic acid):

Tablet: Lamotrigine 25 mg (35s)

Lamictal® (green kit; for patients taking carbamazepine, phenytoin, phenobarbital, primidone, or rifampin and **not** taking valproic acid):

Tablet: Lamotrigine 25 mg (84s)

Tablet: Lamotrigine 100 mg (14s)

Lamictal® (orange kit; for patients **not** taking carbamazepine, phenytoin, phenobarbital, primidone, rifampin, or valproic acid):

Tablet: Lamotrigine 25 mg (42s)

Tablet: Lamotrigine 100 mg (7s)

Tablet, dispersible/chewable: 5 mg, 25 mg

Lamictal®: 2 mg, 5 mg, 25 mg [black currant flavor]

Generic AvailableYes

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablet, orally-disintegrating (Lamictal)

25 mg (30): $153.19

Tablet, orally-disintegrating (Lamotrigine)

25 mg (30): $89.99

Tablets (Lamictal)

25 mg (60): $279.99

100 mg (60): $319.99

150 mg (60): $349.99

200 mg (60): $389.99

Tablets (Lamotrigine)

25 mg (100): $385.97

100 mg (100): $400.00

150 mg (60): $296.82

200 mg (60): $323.14

Mechanism of ActionA triazine derivative which inhibits release of glutamate (an excitatory amino acid) and inhibits voltage-sensitive sodium channels, which stabilizes neuronal membranes. Lamotrigine has weak inhibitory effect on the 5-HT$_3$ receptor; *in vitro* inhibits dihydrofolate reductase.

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: V$_d$: ~1 L/kg

Protein binding: 55%

Metabolism: Hepatic and renal; metabolized by glucuronic acid conjugation to inactive metabolites

Bioavailability: 98%

Half-life elimination: Adults: 25-33 hours

Concomitant valproic acid therapy: 59-70 hours

Concomitant phenytoin or carbamazepine therapy: 13-14 hours

Chronic renal failure: 43 hours

Hemodialysis: 13 hours during dialysis; 57 hours between dialysis

Hepatic impairment: 26-148 hours

Time to peak, plasma: 1-5 hours

Excretion: Urine (94%, ~90% as glucuronide conjugates and ~10% unchanged); feces (2%)

Related Information

- Adverse Effects of Approved Mood Stabilizers / Anticonvulsants
- Agents Approved for Bipolar Disorder
- Anticonvulsant Drugs of Choice

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentValproic acid decreases clearance of lamotrigine; carbamazepine may decrease effects of lamotrigine

Mental Health CommentLamotrigine is useful for the maintenance treatment of bipolar disorder. Best efficacy appears to be in the prophylaxis of depressive episodes. This medication requires a slow titration process. If patient is receiving valproic acid and/or carbamazepine, a dosage adjustment is necessary (see Dosage).

Potentially life-threatening skin rashes have been reported. These appear to be more frequent in pediatric patients and is associated with high serum levels, use of higher than recommended starting dose, and rapid dose titration. The majority of cases occur within the first 8 weeks of treatment. The combination use with valproate may increase this risk. Discontinue if rash develops.

Medication Safety Issues

Sound-alike/look-alike issues:

Somatuline® may be confused with somatropin, SUMAtriptan

International issues:

Somatuline® may be confused with Soma® which is a brand name for carisoprodol in the U.S.

Pronunciation(lan REE oh tide)

U.S. Brand NamesSomatuline® Depot

Canadian Brand NamesSomatuline® Autogel®

Pharmacologic CategorySomatostatin Analog

Use: Labeled IndicationsLong-term treatment of acromegaly in patients who are not candidates for or are unresponsive to surgery and/or radiotherapy

Canadian labeling: Also approved in Canada for relief of symptoms of acromegaly

Dosing: AdultsAcromegaly: **Note: Differences in U.S. and Canadian labeled dosing:** SubQ:

U.S. labeling: Adults: 90 mg once every 4 weeks for 3 months; after initial 90 days of therapy, adjust dose based on clinical response of patient, growth hormone (GH) levels, and/or insulin-like growth factor 1 (IGF-1) levels as follows:

GH ≤1 ng/mL, IGF-1 normal, symptoms stable:60 mg once every 4 weeks

GH >1-2.5 ng/mL, IGF-1 normal, symptoms stable: 90 mg once every 4 weeks

GH >2.5 ng/mL, IGF-1 elevated and/or uncontrolled symptoms: 120 mg once every 4 weeks

Canadian labeling: Children ≥16 years and Adults: 90 mg once every 4 weeks for 3 months; after initial 90 days of therapy, adjust dose based on clinical response of patient, growth hormone (GH) levels, and/or insulin-like growth factor 1 (IGF-1) levels as follows:

GH = 1 ng/mL, IGF-1 normal, symptoms stable: 60 mg once every 4 weeks

GH >1-2.5 ng/mL, IGF-1 normal, symptoms stable: 90 mg once every 4 weeks

GH >2.5 ng/mL, IGF-1 elevated and/or uncontrolled symptoms: 120 mg once every 4 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric
Acromegaly: Children ≥16 years (*Canadian labeling*): Refer to adult dosing.

Dosing: Renal Impairment
U.S. labeling: Moderate-to-severe impairment: Recommended starting dose: 60 mg

Canadian labeling: No adjustment is necessary

Dosing: Hepatic Impairment
U.S. labeling: Moderate-to-severe impairment: Recommended starting dose: 60 mg

Canadian labeling: No adjustment is necessary

Administration: OtherSubQ: Administer by deep subcutaneous injection into superior outer quadrant of buttocks. Do not fold skin. Alternate injection sites.

StorageStore under refrigeration 2°C to 8°C (36°F to 46°F). Protect from light. Allow to reach room temperature by removing sealed pouch from refrigerator 30 minutes prior to administration; keep in sealed pouch until just prior to administration.

Contraindications

There are no contraindications listed in the manufacturer’s labeling.

Canadian labeling contraindications: Hypersensitivity to lanreotide, somatostatin (or related peptides), or any component of the formulation; complicated, untreated lithiasis of the bile ducts

Warnings/Precautions

Concerns related to adverse effects:

- Cholelithiasis: May reduce gall bladder motility, leading to gall stone formation (may be dose- or duration-related); monitor. **Note:** In Canada, ultrasonography is recommended with the initiation of therapy and periodically thereafter.
- Hyper-/hypoglycemia: Inhibition of insulin and glucagon secretion may affect glucose regulation, leading to hyper-/hypoglycemia. Carefully monitor blood glucose levels with the initiation of therapy and with dosage alterations. Use with caution in patients with diabetes; may require dosage adjustments in antidiabetic therapy.
- Hypothyroidism: Decreases (slight) in thyroid function have been observed during therapy; may require monitoring of thyroid function tests.

Disease-related concerns:

- Cardiac disorders: Bradycardia, sinus bradycardia, and hypertension have been observed with therapy. Use with caution in patients with preexisting cardiac disease. Patients without preexisting cardiac disease may experience a decrease in heart rate though not to the level of bradycardia.
- Hepatic impairment: Use with caution in patients with hepatic impairment; lower doses are recommended at therapy initiation in patients with moderate-to-severe impairment.
- Renal impairment: Use with caution in patients with renal impairment; lower doses are recommended at therapy initiation in patients with moderate-to-severe impairment.

Concurrent drug therapy issues:

- Cyclosporine: Concurrent use with cyclosporine may result in decreased serum levels of cyclosporine; monitor.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children. **Note:** In Canada, safety and efficacy have not been established in children <16 years of age.

Dosage form specific issues:

- Latex: The packaging (needle cover) may contain latex.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated embryocidal and teratogenic effects, as well as transitory growth retardation. Very little data exists from clinical trials and/or postmarketing reports of lanreotide in pregnancy. There are no adequate and well-controlled studies in pregnant women. Use in pregnancy only if benefits outweigh potential risks to fetus.

Lactation

Excretion into breast milk unknown/not recommended

Adverse Reactions

>10%:

Cardiovascular: Bradycardia (5% to 18%)

Gastrointestinal: Diarrhea (26% to 65%; dose related), abdominal pain (7% to 19%; dose related), flatulence (≤14%; dose related), nausea (11%), weight loss (5% to 11%)

Hematologic: Anemia (3% to 14%)

Hepatic: Cholelithiasis/gall bladder sludge (2% to 20%)

Local: Injection site reaction (6% to 22%; induration: 5%; pain: 4%; mass: 2%)

1% to 10%:

Cardiovascular: Hypertension (5%), sinus bradycardia (3%)

Central nervous system: Headache (7%)

Endocrine & metabolic: Hyper-/hypoglycemia/diabetes (7%)

Gastrointestinal: Constipation (8%), vomiting (7%), loose stools (6%)

Neuromuscular & skeletal: Arthralgia (7%)

<1%, postmarketing, and/or case reports: Allergic skin reaction, aortic valve regurgitation, dysautonomia, injection site pruritus, mitral valve regurgitation, steatorrhea

Drug Interactions

Codeine: Somatostatin Analogs may decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

CycloSPORINE: Somatostatin Analogs may decrease the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Pegvisomant: Somatostatin Analogs may enhance the adverse/toxic effect of Pegvisomant. Specifically, this combination may increase the risk for significant elevations of liver enzymes. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Herb/Nutraceutical: Avoid hypoglycemic herbs, including alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng, gymnema, marshmallow, and stinging nettle (may enhance the hypoglycemic effect of lanreotide).

Monitoring Parameters Serum GH, IGF-1, glucose levels, thyroid function (where clinically indicated); heart rate, gall bladder ultrasonography (prior to initiation and periodically during therapy)

Monitoring: Lab Tests Serum GH, IGF-1, glucose levels, thyroid function (where clinically indicated)

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution:

Somatuline® Autogel® [CAN]: 60 mg/ 0.3 mL (0.3 mL); 90 mg/ 0.3 mL (0.3 mL); 120 mg/0.5 mL (0.5 mL) [packaging contains natural rubber/natural latex]

Somatuline® Depot®: 60 mg/~0.4 mL (~0.4 mL); 90 mg/~0.4 mL (~0.4 mL); 120 mg/~0.5 mL (~0.5 mL) [packaging contains natural rubber/natural latex]

ManufacturerIpsen Pharma Biotech [U.S.]; Ipsen Limited [CAN]

Mechanism of Action Synthetic octapeptide analogue of somatostatin which is a peptide inhibitor of multiple endocrine, neuroendocrine, and exocrine mechanisms. Displays a greater affinity for somatostatin type 2 (SSTR2) and type 5 (SSTR5) receptors found in pituitary gland, pancreas, and growth hormone (GH) secreting neoplasms of pituitary gland and a lesser affinity for somatostatin receptors 1, 3, and 4. Reduces GH secretion and also reduces the levels of insulin-like growth factor 1.

Pharmacodynamics/Kinetics

Distribution: V_{ss}: ~0.2 L/kg

Protein binding: 79% to 83%

Metabolism: Extensively within GI tract after biliary excretion

Bioavailability: 69% to 83%

Half-life, elimination: 23-36 days

Time to peak, plasma: Mean: 7-12 hours

Excretion: Urine (<1% to 5% as unchanged drug); feces (<0.5% as unchanged drug)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Clopidogrel (Plavix®) and Proton Pump Inhibitors (PPIs): Ongoing Safety Review - January 2009

The U.S. Food and Drug Administration (FDA) is communicating important information regarding an ongoing safety review of clopidogrel and its effectiveness when used with proton pump inhibitors (PPIs).

Clopidogrel is a prodrug requiring hepatic conversion via CYP3A4 and/or CYP2C19 to its active metabolite. Impaired clopidogrel conversion to its active metabolite may be due to either CYP450 polymorphisms or drug-drug interactions resulting in suboptimal antiplatelet activity.

A PPI is often prescribed with the combination of aspirin and clopidogrel to prevent gastrointestinal bleeding. A number of PPIs are available and include esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole. Several studies have reported greater clinical event rates (eg, myocardial infarction, death) or greater platelet reactivity associated with concurrent use of clopidogrel and a PPI (Ho, 2008; Pezella, 2008; Gilard, 2006). Similarly, a prospective, randomized, double-blind trial demonstrated a reduction in antiplatelet activity when omeprazole and clopidogrel are used concurrently (Gilard, 2008). Another controlled trial with the PPI lansoprazole also found evidence of a possible interaction resulting in less antiplatelet activity (Small, 2008). This interaction is thought to result from competitive inhibition of the CYP2C19-mediated activation of clopidogrel by omeprazole and other PPIs, which are all metabolized to at least some degree by CYP2C19. In contrast, one study with esomeprazole and pantoprazole did not find evidence of reduced antiplatelet activity when administered with clopidogrel (Siller-Matula, 2009), highlighting the need for additional studies to determine the degree to which individual PPIs may differ in their potential for interacting with clopidogrel.

The manufacturer of Plavix® has agreed to conduct further studies to better understand the effect of other drugs (including PPIs) and genetic factors on the effectiveness of clopidogrel. The FDA is recommending that healthcare providers continue to prescribe clopidogrel while reevaluating the need for prescription or over-the-counter (OTC) PPIs in patients taking clopidogrel. Patients should continue taking clopidogrel as directed. If taking a PPI with clopidogrel, patients should consult with their healthcare provider.

For more information, healthcare professionals may refer to the following FDA website:
http://www.fda.gov/cder/drug/early_comm/clopidogrel_bisulfate.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Prevacid® may be confused with Pravachol®, Prevpac®, Prilosec®, Prinivil®

Pronunciation(lan SOE pra zole & na PROKS en)

U.S. Brand NamesPrevacid® NapraPAC®

Pharmacologic Category[Nonsteroidal Anti-inflammatory Drug (NSAID), Oral](Nonsteroidal Anti-inflammatory Drug (NSAID), Oral); Proton Pump Inhibitor

Use: Labeled IndicationsReduction of the risk of NSAID-associated gastric ulcers in patients with history of gastric ulcer who require an

NSAID for the treatment of rheumatoid arthritis, osteoarthritis, and ankylosing spondylitis

Dosing: AdultsReduce NSAID-associated gastric ulcers during treatment for arthritis: Oral: Lansoprazole 15 mg once daily in the morning; naproxen 500 mg twice daily

Dosing: ElderlyNaproxen: Dosing adjustment should be considered.

Dosing: Renal ImpairmentNaproxen: Cl_{cr} <30 mL/minute: use is not recommended.

Dosing: Hepatic Impairment

Lansoprazole: Severe liver disease: consider dosage adjustment.

Naproxen: Consider dosage adjustment in patients with liver disease.

Administration: OralMorning doses should be taken prior to eating and with a glass of water; evening dose should be taken with a glass of water. Lansoprazole capsules should be swallowed whole; do not crush or chew.

Dietary ConsiderationsMorning doses should be taken prior to eating and with a glass of water; evening dose should be taken with a glass of water

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to lansoprazole, naproxen, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy
- Proton Pump Inhibitor, Benzimidazole Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Naproxen therapy may cause anaphylactoid reactions, even without prior exposure; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.
- Atrophic gastritis: Long-term omeprazole therapy has caused atrophic gastritis (by biopsy); this may also occur with lansoprazole.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Carcinoma: No occurrences of enterochromaffin-like (ECL) cell carcinoids, dysplasia, or neoplasia, such as those seen in rodent studies, have been reported in humans.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding, inflammatory bowel disease, ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.
- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.
- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.

- Gastrointestinal infection (eg, *Salmonella, Campylobacter*): Use of proton pump inhibitors may increase risk of these infections.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Naproxen is not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy of this combination product have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric Considerations

The elderly are at increased risk for adverse effects from NSAIDs. As many as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high-dose situations; however, elderly patients may demonstrate these adverse effects at lower doses than younger adults. The elderly are also at increased risk of renal toxicity.

Pregnancy Risk FactorC (naproxen: D/third trimester)
Pregnancy ConsiderationsTeratogenic effects were not observed with lansoprazole or naproxen in animal studies. Naproxen use late in pregnancy is associated with persistent pulmonary hypertension, renal dysfunction, and abnormal prostaglandin E levels in preterm infants. Exposure to NSAIDs late in pregnancy may lead to premature closure of the ductus arteriosus and may inhibit uterine contractions. Use of this combination product is not recommended for use during pregnancy unless clearly needed.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsNaproxen is excreted in breast milk; excretion of lansoprazole is unknown. Breast-feeding is not recommended.
Adverse ReactionsSee individual agents.
Metabolism/Transport Effects

Lansoprazole: **Substrate** of CYP2C9 (minor), 2C19 (major), 3A4 (major); **Inhibits** CYP2C9 (weak), 2C19 (moderate), 2D6 (weak), 3A4 (weak); **Induces** CYP1A2 (weak)

Naproxen: **Substrate** (minor) of CYP1A2, 2C9

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Atazanavir: Proton Pump Inhibitors may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Clopidogrel: Proton Pump Inhibitors may diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory

Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: Proton Pump Inhibitors may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Proton Pump Inhibitors may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Erlotinib: Proton Pump Inhibitors may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Fluconazole: May increase the serum concentration of Proton Pump Inhibitors. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Imatinib: Lansoprazole may enhance the dermatologic adverse effect of Imatinib. *Risk C: Monitor therapy*

Indinavir: Proton Pump Inhibitors may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: Proton Pump Inhibitors may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Itraconazole: Proton Pump Inhibitors may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Ketoconazole: Proton Pump Inhibitors may decrease the serum concentration of Ketoconazole. Ketoconazole may increase the serum concentration of Proton Pump Inhibitors. *Risk D: Consider therapy modification*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Mesalamine: Proton Pump Inhibitors may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; proton pump inhibitors would be expected to interact in a similar manner. *Risk X: Avoid combination*

Methotrexate: Proton Pump Inhibitors may decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Mycophenolate: Proton Pump Inhibitors may decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Nelfinavir: Proton Pump Inhibitors may decrease serum concentrations of the active metabolite(s) of Nelfinavir. Proton Pump Inhibitors may decrease the serum concentration of Nelfinavir. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Saquinavir: Proton Pump Inhibitors may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tipranavir: May decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: Proton Pump Inhibitors may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Monitoring ParametersOccult blood loss, periodic liver function test, CBC, BUN, serum creatinine
Nursing: Physical Assessment/MonitoringSee individual agents.
Monitoring: Lab TestsOccult blood loss, periodic liver function test, CBC, BUN, serum creatinine
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Combination package:

Prevacid® NapraPAC® 500 [each administration card contains]:

Capsule, delayed release (Prevacid®): Lansoprazole 15 mg (7 capsules per card)

Tablet (Naprosyn®): Naproxen 500 mg (14 tablets per card)

Generic AvailableNo
ManufacturerTakeda Pharmaceuticals
Pricing: U.S. (www.drugstore.com)

Kit (Prevacid NapraPAC)

15-500 mg (84): $153.28

Mechanism of Action

Lansoprazole: Proton pump inhibitor which decreases acid secretion in gastric parietal cells

Naproxen: Reversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/KineticsSee individual agents.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness or sedation; may rarely cause confusion, insomnia, depression, or hallucinations
Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine, carbamazepine, and mirtazapine. May decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels. Combined use with SSRIs may increase bleeding risk.
Index TermsNapraPAC®; Naproxen and Lansoprazole

Lansoprazole, Amoxicillin, and Clarithromycin

Clopidogrel (Plavix®) and Proton Pump Inhibitors (PPIs): Ongoing Safety Review - January 2009

The U.S. Food and Drug Administration (FDA) is communicating important information regarding an ongoing safety review of clopidogrel and its effectiveness when used with proton pump inhibitors (PPIs).

Clopidogrel is a prodrug requiring hepatic conversion via CYP3A4 and/or CYP2C19 to its active metabolite. Impaired clopidogrel conversion to its active metabolite may be due to either CYP450 polymorphisms or drug-drug interactions resulting in suboptimal antiplatelet activity.

A PPI is often prescribed with the combination of aspirin and clopidogrel to prevent gastrointestinal bleeding. A number of PPIs are available and include esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole. Several studies have reported greater clinical event rates (eg, myocardial infarction, death) or greater platelet reactivity associated with concurrent use of clopidogrel and a PPI (Ho, 2008; Pezella, 2008; Gilard, 2006). Similarly, a prospective, randomized, double-blind trial demonstrated a reduction in antiplatelet activity when omeprazole and clopidogrel are used concurrently (Gilard, 2008). Another controlled trial with the PPI lansoprazole also found evidence of a possible interaction resulting in less antiplatelet activity (Small, 2008). This interaction is thought to result from competitive inhibition of the CYP2C19-mediated activation of clopidogrel by omeprazole and other PPIs, which are all metabolized to at least some degree by CYP2C19. In contrast, one study with esomeprazole and pantoprazole did not find evidence of reduced antiplatelet activity when administered with clopidogrel (Siller-Matula, 2009), highlighting the need for additional studies to determine the degree to which individual PPIs may differ in their potential for interacting with clopidogrel.

The manufacturer of Plavix® has agreed to conduct further studies to better understand the effect of other drugs (including PPIs) and genetic factors on the effectiveness of clopidogrel. The FDA is recommending that healthcare providers continue to prescribe clopidogrel while reevaluating the need for prescription or over-the-counter (OTC) PPIs in patients taking clopidogrel. Patients should continue taking clopidogrel as directed. If taking a PPI with clopidogrel, patients should consult with their healthcare provider.

For more information, healthcare professionals may refer to the following FDA website: http://www.fda.gov/cder/drug/early_comm/clopidogrel_bisulfate.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Prevpac® may be confused with Prevacid®

Pronunciation(lan SOE pra zole, a moks i SIL in, & kla RITH roe mye sin)

U.S. Brand NamesPrevpac®

Canadian Brand NamesHp-PAC®; Prevpac®

Pharmacologic CategoryAntibiotic, Macrolide Combination; Antibiotic, Penicillin; Gastrointestinal Agent, Miscellaneous

Use: Labeled IndicationsEradication of *H. pylori* to reduce the risk of recurrent duodenal ulcer

Dosing: Adults*H. pylori* eradication: Oral: Lansoprazole 30 mg, amoxicillin 1 g, and clarithromycin 500 mg taken together twice daily for 10 or

14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute: Use is not recommended.

Calculations

- Creatinine Clearance: Adults

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light and moisture.

ContraindicationsHypersensitivity to lansoprazole, amoxicillin, any penicillin, clarithromycin, any macrolide, or any component of the formulation; concurrent use with pimozide, cisapride, or ergot derivatives (eg, ergotamine, dihydroergotamine)

Allergy Considerations

- Macrolide Allergy
- Penicillin Allergy
- Proton Pump Inhibitor, Benzimidazole Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: Macrolides have been associated with rare QT_c prolongation and ventricular arrhythmias, including torsade de pointes; use with caution in patients at risk of prolonged cardiac repolarization.
- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.
- Atrophic gastritis: Long-term omeprazole therapy has caused atrophic gastritis (by biopsy); this may also occur with lansoprazole.
- Superinfection: Prolonged use of amoxicillin or clarithromycin may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Gastrointestinal infection (eg, *Salmonella, Campylobacter*): Use of proton pump inhibitors may increase risk of these infections.
- Infectious mononucleosis: A high percentage of patients with infectious mononucleosis have developed rash during amoxicillin therapy; ampicillin-class antibiotics not recommended in these patients.
- Hepatic impairment: Use lansoprazole with caution in patients with severe hepatic impairment; dosage reductions recommended.
- Renal impairment: Use amoxicillin with caution in patients with renal impairment; dosage adjustment recommended. Use clarithromycin with caution in severe renal impairment; dosage adjustment required.

Pregnancy Risk FactorC (clarithromycin)

Pregnancy ConsiderationsSee individual agents.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsSee individual agents.

Adverse Reactions**Note:** Frequencies noted refer to experience with combination therapy. Also see individual agents.

3% to 10%:

Central nervous system: Headache (6%)

Gastrointestinal: Diarrhea (7%), taste perversion (5%)

<3%: Abdominal pain, candidiasis (oral and vaginal), confusion, dark stools, dermatologic reactions, dizziness, dry mouth, glossitis, myalgia, nausea, rectal itching, stomatitis, thirst, tongue discoloration, vaginitis, vomiting

Metabolism/Transport Effects

Lansoprazole: **Substrate** of CYP2C9 (minor), 2C19 (major), 3A4 (major); **Inhibits** CYP2C9 (weak), 2C19 (moderate), 2D6 (weak), 3A4 (weak); **Induces** CYP1A2 (weak)

Clarithromycin: **Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (weak), 3A4 (strong)

Drug Interactions

Alfentanil: Macrolide Antibiotics may decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Allopurinol: May enhance the potential for allergic or hypersensitivity reactions to Amoxicillin. *Risk C: Monitor therapy*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Macrolide Antibiotics may decrease the metabolism of Antifungal Agents (Azole Derivatives, Systemic). Antifungal Agents (Azole Derivatives, Systemic) may decrease the metabolism of Macrolide Antibiotics. *Risk D: Consider therapy modification*

Atazanavir: Proton Pump Inhibitors may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Macrolide Antibiotics may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

BusPIRone: Macrolide Antibiotics may decrease the metabolism of BusPIRone. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Macrolide Antibiotics may decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

CarBAMazepine: Macrolide Antibiotics may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Cardiac Glycosides: Macrolide Antibiotics may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cilostazol: Macrolide Antibiotics may decrease the metabolism of Cilostazol. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Macrolide Antibiotics may decrease the metabolism of Cisapride. *Risk X: Avoid combination*

Clopidogrel: Macrolide Antibiotics may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Clopidogrel: Proton Pump Inhibitors may diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

Clozapine: Macrolide Antibiotics may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

Colchicine: Macrolide Antibiotics may decrease the metabolism of Colchicine. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Macrolide Antibiotics may decrease the metabolism of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

CycloSPORINE: Macrolide Antibiotics may decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: Proton Pump Inhibitors may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Proton Pump Inhibitors may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Macrolide Antibiotics may enhance the QTc-prolonging effect of Disopyramide. Macrolide Antibiotics may decrease the metabolism of Disopyramide. *Risk X: Avoid combination*

Eletriptan: Macrolide Antibiotics may decrease the metabolism of Eletriptan. *Risk D: Consider therapy modification*

Eplerenone: Macrolide Antibiotics may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Macrolide Antibiotics may enhance the adverse/toxic effect of Ergot Derivatives. Specifically leading the development of ergotism. **Exceptions:** Cabergoline. *Risk D: Consider therapy modification*

Erlotinib: Proton Pump Inhibitors may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Etravirine: May decrease the serum concentration of Macrolide Antibiotics. Clarithromycin AUC is reduced and levels of the active metabolite (14-hydroxy-clarithromycin) are modestly increased. Management: For the treatment of *Mycobacterium avium* complex, consider changing to alternative agent, such as azithromycin. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fluconazole: May increase the serum concentration of Proton Pump Inhibitors. *Risk C: Monitor therapy*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Macrolide Antibiotics may decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Fluvastatin; Pravastatin; Rosuvastatin. *Risk D: Consider therapy modification*

Imatinib: Lansoprazole may enhance the dermatologic adverse effect of Imatinib. *Risk C: Monitor therapy*

Indinavir: Proton Pump Inhibitors may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: Proton Pump Inhibitors may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Itraconazole: Proton Pump Inhibitors may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Ketoconazole: Proton Pump Inhibitors may decrease the serum concentration of Ketoconazole. Ketoconazole may increase the serum concentration of Proton Pump Inhibitors. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mesalamine: Proton Pump Inhibitors may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; proton pump inhibitors would be expected to interact in a similar manner. *Risk X: Avoid combination*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Methotrexate: Proton Pump Inhibitors may decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Mycophenolate: Proton Pump Inhibitors may decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Nelfinavir: Proton Pump Inhibitors may decrease serum concentrations of the active metabolite(s) of Nelfinavir. Proton Pump Inhibitors may decrease the serum concentration of Nelfinavir. *Risk X: Avoid combination*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Macrolide Antibiotics may decrease the metabolism of Phosphodiesterase 5 Inhibitors. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Macrolide Antibiotics may decrease the metabolism of Pimozide. QTc prolongation is a risk. *Risk X: Avoid combination*

Protease Inhibitors: May diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Macrolide Antibiotics may decrease the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Repaglinide: Macrolide Antibiotics may increase the serum concentration of Repaglinide. *Risk C: Monitor therapy*

Rifamycin Derivatives: Macrolide Antibiotics may decrease the metabolism of Rifamycin Derivatives. **Exceptions:** Rifapentine. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Saquinavir: Proton Pump Inhibitors may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Macrolide Antibiotics may decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Fluvoxamine; PARoxetine. *Risk C: Monitor therapy*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Macrolide Antibiotics may decrease the metabolism of Sirolimus. *Risk D: Consider therapy modification*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Tacrolimus: Macrolide Antibiotics may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: Macrolide Antibiotics may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Theophylline Derivatives: Macrolide Antibiotics may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Tipranavir: May decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Macrolide Antibiotics may decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Voriconazole: Proton Pump Inhibitors may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Zopiclone: Macrolide Antibiotics may increase the serum concentration of Zopiclone. *Risk D: Consider therapy modification*

Clopidogrel (Plavix®) and Proton Pump Inhibitors (PPIs): Ongoing Safety Review - January 2009

The U.S. Food and Drug Administration (FDA) is communicating important information regarding an ongoing safety review of clopidogrel and its effectiveness when used with proton pump inhibitors (PPIs).

Clopidogrel is a prodrug requiring hepatic conversion via CYP3A4 and/or CYP2C19 to its active metabolite. Impaired clopidogrel conversion to its active metabolite may be due to either CYP450 polymorphisms or drug-drug interactions resulting in suboptimal antiplatelet activity.

A PPI is often prescribed with the combination of aspirin and clopidogrel to prevent gastrointestinal bleeding. A number of PPIs are available and include esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole. Several studies have reported greater clinical event rates (eg, myocardial infarction, death) or greater platelet reactivity associated with concurrent use of clopidogrel and a PPI (Ho, 2008; Pezella, 2008; Gilard, 2006). Similarly, a prospective, randomized, double-blind trial demonstrated a reduction in antiplatelet activity when omeprazole and clopidogrel are used concurrently (Gilard, 2008). Another controlled trial with the PPI lansoprazole also found evidence of a possible interaction resulting in less antiplatelet activity (Small, 2008). This interaction is thought to result from competitive inhibition of the CYP2C19-mediated activation of clopidogrel by omeprazole and other PPIs, which are all metabolized to at least some degree by CYP2C19. In contrast, one study with esomeprazole and pantoprazole did not find evidence of reduced antiplatelet activity when administered with clopidogrel (Siller-Matula, 2009), highlighting the need for additional studies to determine the degree to which individual PPIs may differ in their potential for interacting with clopidogrel.

The manufacturer of Plavix® has agreed to conduct further studies to better understand the effect of other drugs (including PPIs) and genetic factors on the effectiveness of clopidogrel. The FDA is recommending that healthcare providers continue to prescribe clopidogrel while reevaluating the need for prescription or over-the-counter (OTC) PPIs in patients taking clopidogrel. Patients should continue taking clopidogrel as directed. If taking a PPI with clopidogrel, patients should consult with their healthcare provider.

For more information, healthcare professionals may refer to the following FDA website: http://www.fda.gov/cder/drug/early_comm/clopidogrel_bisulfate.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Prevacid® may be confused with Pravachol®, Prevpac®, Prilosec®, Prinivil®

Pronunciation(lan SOE pra zole)

U.S. Brand NamesPrevacid®; Prevacid® SoluTab™

Canadian Brand NamesPrevacid®

Pharmacologic CategoryProton Pump Inhibitor; Substituted Benzimidazole

Use: Labeled IndicationsShort-term treatment of active duodenal ulcers; maintenance treatment of healed duodenal ulcers; as part of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence; short-term treatment of active benign gastric ulcer;

treatment of NSAID-associated gastric ulcer; to reduce the risk of NSAID-associated gastric ulcer in patients with a history of gastric ulcer who require an NSAID; short-term treatment of symptomatic GERD; short-term treatment for all grades of erosive esophagitis; to maintain healing of erosive esophagitis; long-term treatment of pathological hypersecretory conditions, including Zollinger-Ellison syndrome

Dosing: Adults

Symptomatic GERD: Oral: Short-term treatment: 15 mg once daily for up to 8 weeks

Erosive esophagitis: Oral: Short-term treatment: 30 mg once daily for up to 8 weeks; continued treatment for an additional 8 weeks may be considered for recurrence or for patients who do not heal after the first 8 weeks of therapy; maintenance therapy: 15 mg once daily

Hypersecretory conditions: Oral: Initial: 60 mg once daily; adjust dose based upon patient response and to reduce acid secretion to <10 mEq/hour (5 mEq/hour in patients with prior gastric surgery); doses of 90 mg twice daily have been used; administer doses >120 mg/day in divided doses

Duodenal ulcer: Oral: Short-term treatment: 15 mg once daily for 4 weeks; maintenance therapy: 15 mg once daily

Peptic ulcer disease: Eradication of *Helicobacter pylori*: Currently accepted recommendations (may differ from product labeling): Oral: Dose varies with regimen: 30 mg once daily or 60 mg/day in 2 divided doses; requires combination therapy with antibiotics

Gastric ulcer: Oral: Short-term treatment: 30 mg once daily for up to 8 weeks

NSAID-associated gastric ulcer (healing): Oral: 30 mg once daily for 8 weeks; controlled studies did not extend past 8 weeks

NSAID-associated gastric ulcer (to reduce risk): Oral: 15 mg once daily for up to 12 weeks; controlled studies did not extend past 12 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

GERD, erosive esophagitis: Oral: Children 1-11 years:

≤30 kg: 15 mg once daily

>30 kg: 30 mg once daily

Note: Doses were increased in some pediatric patients if still symptomatic after 2 or more weeks of treatment (maximum dose: 30 mg twice daily)

Erosive esophagitis: Children 12-17 years: Oral: 30 mg once daily for up to 8 weeks

Nonerosive GERD: Children 12-17 years: Oral: 15 mg once daily for up to 8 weeks

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentMay require a dose reduction.

Administration: Oral

Administer before food; best if taken before breakfast. The intact granules should not be chewed or crushed; however, several options are available for those patients unable to swallow capsules:

Capsules may be opened and the intact granules sprinkled on 1 tablespoon of applesauce, Ensure® pudding, cottage cheese, yogurt, or strained pears. The granules should then be swallowed immediately.

Capsules may be opened and emptied into ~60 mL orange juice, apple juice, or tomato juice; mix and swallow immediately. Rinse the glass with additional juice and swallow to assure complete delivery of the dose.

Orally-disintegrating tablets: Should not be swallowed whole or chewed. Place tablet on tongue; allow to dissolve (with or without water) until particles can be swallowed. Orally-disintegrating tablets may also be administered via an oral syringe: Place the 15 mg tablet in an oral syringe and draw up ~4 mL water, or place the 30 mg tablet in an oral syringe and draw up ~10 mL water. After tablet has dispersed, administer within 15 minutes. Refill the syringe with water (2 mL for the 15 mg tablet; 4 mL for the 30 mg tablet), shake gently, then administer any remaining contents.

Administration: OtherNasogastric tube administration:

Capsule: Capsule can be opened, the granules mixed (not crushed) with 40 mL of apple juice and then injected through the NG tube into the stomach, then flush tube with additional apple juice. Do not mix with other liquids.

Orally-disintegrating tablet: Nasogastric tube ≥8 French: Place a 15 mg tablet in a syringe and draw up ~4 mL water, or place the 30 mg tablet in a syringe and draw up ~10 mL water. After tablet has dispersed, administer within 15 minutes. Refill the syringe with ~5 mL water, shake gently, and then flush the nasogastric tube.

Dietary ConsiderationsShould be taken before eating; best if taken before breakfast. Prevacid® SoluTab™ contains phenylalanine 2.5 mg per 15 mg tablet; phenylalanine 5.1 mg per 30 mg tablet.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

Extemporaneously PreparedA 3 mg/mL lansoprazole oral solution (Simplified Lansoprazole Solution) can be prepared with ten lansoprazole 30 mg capsules and 100 mL 8.4% sodium bicarbonate. Empty capsules into beaker. Add sodium bicarbonate solution. Gently stir (about 15 minutes) until dissolved. Transfer to amber-colored syringe or bottle. Stable for 8 hours at room temperature or for 14 days under refrigeration.

Pharm, 1999, 56(Suppl 4):S18-21.

Sharma VK, Vasudeva R, and Howden CW, “Simplified Lansoprazole Suspension - Liquid Formulations of Lansoprazole - Effectively Suppresses Intragastric Acidity When Administered Through a Gastrostomy,” *Am J Gastroenterol*, 1999, 94(7):1813-7.

Contraindications Hypersensitivity to lansoprazole, substituted benzimidazoles (ie, esomeprazole, omeprazole, pantoprazole, rabeprazole), or any component of the formulation

Allergy Considerations

- Proton Pump Inhibitor, Benzimidazole Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Atrophic gastritis: Long-term omeprazole therapy has caused atrophic gastritis (by biopsy); this may also occur with lansoprazole.
- Carcinoma: No reports of enterochromaffin-like (ECL) cell carcinoids, dysplasia, or neoplasia has occurred.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Gastrointestinal infection (eg, *Salmonella, Campylobacter*): Use of proton pump inhibitors may increase risk of these infections.
- Hepatic impairment: Patients with severe liver dysfunction may require dosage reductions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Dosage form specific issues:

- Phenylalanine: Prevacid® SoluTab™ contains phenylalanine.

Geriatric Considerations The clearance of lansoprazole is decreased in the elderly; however, the half-life is only increased by 50% to 100%, resulting in a short half-life and no accumulation in the elderly. No dosage adjustment is required with normal hepatic function. The rate of healing and side effects are similar to younger adults.

Pregnancy Risk Factor B

Pregnancy Considerations Animal studies have not shown teratogenic effects to the fetus. However, there are no adequate and well-controlled studies in pregnant women; use during pregnancy only if clearly needed.

Lactation Excretion in breast milk unknown/not recommended

Adverse Reactions

1% to 10%:

Central nervous system: Headache (children 1-11 years 3%, 12-17 years 7%)

Gastrointestinal: Abdominal pain (children 12-17 years 5%; adults 2%), constipation (children 1-11 years 5%; adults 1%), diarrhea (60 mg/day; adults 7%), nausea (children 12-17 years 3%; adults 1%)

<1%: Abdomen enlarged, abnormal dreams, abnormal menses, abnormal stools, abnormal vision, acne, agitation, albuminuria, allergic reaction, alkaline phosphatase increased, ALT increased, alopecia, amnesia, anemia, angina, anorexia, anxiety, apathy, appetite increased, arrhythmia, AST increased, arthralgia, arthritis, asthma, back pain, bezoar, bilirubinemia, blurred vision, bradycardia, breast enlargement, breast pain, breast tenderness, bronchitis, bone disorder, candidiasis, carcinoma, cardiospasm, cerebrovascular accident, cerebral infarction, chest pain, chills, cholelithiasis, cholesterol increased, cholesterol decreased, colitis, confusion, conjunctivitis, contact dermatitis, convulsion, cough increased, creatinine increased, deafness, dehydration, depersonalization, depression, diabetes mellitus, diplopia, dizziness, dry eyes, dry mouth, dry skin, dyspepsia, dysphagia, dyspnea, dysmenorrhea, dysuria, ear disorder, edema, electrolytes imbalance, emotional lability, enteritis, eosinophilia, epistaxis, eructation, esophageal ulcer, esophagitis, eye pain, fecal discoloration, fever, fixed eruption, flatulence, flu-like syndrome, fundic gland polyps, gastric nodules, gastrin levels increased, gastritis, gastroenteritis, gastrointestinal anomaly, gastrointestinal hemorrhage, GGTP increased, GGTP decreased, glucocorticoid levels increased, globulins increased, glossitis, glycosuria, goiter, gout, gum hemorrhage, gynecomastia, hair disorder, halitosis, hallucinations, hematemesis, hematuria, hemiplegia, hemolysis, hemoptysis, hiccup, hostility aggravated, hyper-/hypoglycemia, hyperkinesia, hyperlipemia, hypertonia, hypoesthesia, hyper-/hypotension, hypothyroidism, impotence, infection, insomnia, joint disorder, kidney calculus, kidney pain, laryngeal neoplasia, LDH increased, leg cramps, leukorrhea, libido decreased, libido increased, liver function test abnormal, lymphadenopathy, maculopapular rash, malaise, melena, menorrhagia, menstrual disorder, migraine, moniliasis (oral), mouth ulceration, musculoskeletal pain, myalgia, myasthenia, MI, nail disorder, neck pain, neck rigidity, nervousness, neurosis, otitis media, pain, palpitation, paresthesia, parosmia, pelvic pain, penis disorder, peripheral edema, pharyngitis, photophobia, platelet abnormalities, pleural disorder, pneumonia, polyuria, pruritus, rash, RBC abnormal, rectal disorder, rectal hemorrhage, respiratory disorder, retinal degeneration, rhinitis, salivation increased, shock, sinusitis, skin carcinoma, sleep disorder, somnolence, stomatitis, stridor, sweating, syncope, synovitis, tachycardia, taste loss, taste perversion, tenesmus, testis disorder, thirst, thinking abnormality, thrombocytopenia, tinnitus, tremor, tongue disorder, ulcerative colitis, ulcerative stomatitis, upper respiratory inflammation, upper respiratory infection, urethral pain, urinary frequency, urination impaired, urticaria, vaginitis, vasodilation, vertigo, visual field defect, vomiting, weakness, WBC abnormal, weight gain/loss

Postmarketing and/or case reports: Agranulocytosis, anaphylactoid reaction, aplastic anemia, erythema multiforme, hemolytic anemia, hepatotoxicity, interstitial nephritis, leukopenia, myositis, neutropenia, pancreatitis, pancytopenia, speech disorder, Stevens-Johnson syndrome, thrombotic thrombocytopenic purpura, toxic epidermal necrolysis, urinary retention

Metabolism/Transport Effects **Substrate** of CYP2C9 (minor), 2C19 (major), 3A4 (major); **Inhibits** CYP2C9 (weak), 2C19 (moderate), 2D6 (weak), 3A4 (weak); **Induces** CYP1A2 (weak)

Drug Interactions

Atazanavir: Proton Pump Inhibitors may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Clopidogrel: Proton Pump Inhibitors may diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: Proton Pump Inhibitors may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Proton Pump Inhibitors may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Erlotinib: Proton Pump Inhibitors may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Fluconazole: May increase the serum concentration of Proton Pump Inhibitors. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Imatinib: Lansoprazole may enhance the dermatologic adverse effect of Imatinib. *Risk C: Monitor therapy*

Indinavir: Proton Pump Inhibitors may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: Proton Pump Inhibitors may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Itraconazole: Proton Pump Inhibitors may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Ketoconazole: Proton Pump Inhibitors may decrease the serum concentration of Ketoconazole. Ketoconazole may increase the serum concentration of Proton Pump Inhibitors. *Risk D: Consider therapy modification*

Mesalamine: Proton Pump Inhibitors may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; proton pump inhibitors would be expected to interact in a similar manner. *Risk X: Avoid combination*

Methotrexate: Proton Pump Inhibitors may decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Mycophenolate: Proton Pump Inhibitors may decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Nelfinavir: Proton Pump Inhibitors may decrease serum concentrations of the active metabolite(s) of Nelfinavir. Proton Pump Inhibitors may decrease the serum concentration of Nelfinavir. *Risk X: Avoid combination*

Saquinavir: Proton Pump Inhibitors may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Tipranavir: May decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

Voriconazole: Proton Pump Inhibitors may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause gastric mucosal irritation).

Food: Lansoprazole serum concentrations may be decreased if taken with food.

Herb/Nutraceutical: Avoid St John's wort (may decrease the levels/effect of lansoprazole).

Monitoring ParametersPatients with Zollinger-Ellison syndrome should be monitored for gastric acid output, which should be maintained at ≤10 mEq/hour during the last hour before the next lansoprazole dose; lab monitoring should include CBC, liver function, renal function, and serum gastrin levels

Nursing: Physical Assessment/MonitoringAssess periodic laboratory results and assess effectiveness of medications that require an acid medium for absorption (eg, ketoconazole, itraconazole). Monitor effectiveness of ulcer symptom relief.

Monitoring: Lab TestsCBC, liver function, renal function, and serum gastrin levels. Patients with Zollinger-Ellison syndrome should be monitored for gastric acid output, which should be maintained at ≤10 mEq/hour during the last hour before the next lansoprazole dose.

Patient EducationTake as directed, before eating. Do not crush or chew granules. Patients who may have difficulty swallowing capsules may open the delayed-release capsules and sprinkle the contents on applesauce, pudding, cottage cheese, or yogurt. Avoid alcohol. Report unresolved diarrhea. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, delayed release:

Prevacid®: 15 mg, 30 mg

Tablet, delayed release, orally disintegrating:

Prevacid® SoluTab™: 15 mg [contains phenylalanine 2.5 mg; strawberry flavor]; 30 mg [contains phenylalanine 5.1 mg; strawberry flavor]

Generic AvailableNo
ManufacturerTakeda Pharm Inc
Pricing: U.S. (www.drugstore.com)

Capsule, delayed release (Prevacid)

15 mg (30): $168.69

30 mg (30): $167.98

Tablet, orally-disintegrating (Prevacid SoluTab)

15 mg (100): $557.45

30 mg (30): $159.98

Mechanism of ActionDecreases acid secretion in gastric parietal cells through inhibition of (H+, K+)-ATPase enzyme system, blocking the final step in gastric acid production.
Pharmacodynamics/Kinetics

Duration: >1 day

Absorption: Rapid

Distribution: V_d: 14-18 L

Protein binding: 97%

Metabolism: Hepatic via CYP2C19 and 3A4, and in parietal cells to two active metabolites that are not present in systemic circulation

Bioavailability: 80%; decreased 50% to 70% if given 30 minutes after food

Half-life elimination: 1-2 hours; Elderly: 2-3 hours; Hepatic impairment: ≤7 hours

Time to peak, plasma: 1.7 hours

Excretion: Feces (67%); urine (33%)

Related Information

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness
Mental Health: Effects on Psychiatric TreatmentNone reported
Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Stress ulcer prophylaxis: The 2008 Surviving Sepsis Campaign guidelines recommend that stress ulcer prophylaxis using an H_2 blocker (Grade 1A) or proton pump inhibitor (Grade 1B) be given to patients with severe sepsis to prevent upper GI bleed. Benefit of prevention of upper GI bleed must be weighed against potential effect of increased stomach pH on development of ventilator-associated pneumonia.

Lanthanum

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(LAN tha num)
U.S. Brand NamesFosrenol®
Canadian Brand NamesFosrenol®
Pharmacologic CategoryPhosphate Binder
Use: Labeled IndicationsReduction of serum phosphate in patients with stage 5 chronic kidney disease (end-stage renal disease [ESRD]; kidney failure: GFR <15 mL/minute/1.73 m^2 or dialysis)
Dosing: AdultsInitial: Oral: 1500 mg/day divided and taken with meals; typical increases of 750 mg/day every 2-3 weeks are suggested as needed to bring the serum phosphate level <6 mg/dL. Usual dosage range: 1500-3000 mg; doses of up to 3750 mg have been used.
Dosing: ElderlyRefer to adult dosing.
Administration: OralAdminister with or immediately after meals; tablet should be chewed completely prior to swallowing; do not swallow whole. Tablet may be crushed to aid in chewing.
Dietary ConsiderationsTake with or immediately after meals.
StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture.
ContraindicationsThere are no contraindications listed within the manufacturer's labeling.
Warnings/Precautions

Disease-related concerns:

- Gastrointestinal disease: Use with caution in patients with active peptic ulcer, ulcerative colitis, Crohn's disease, or bowel obstruction.

Special populations:

- Pediatrics: Use in children is not recommended; lanthanum deposits into developing bone, including growth plates; the consequences on developing bone are not known.

Other warnings/precautions:

- Abdominal x-rays: May have a radiopaque appearance in patients taking lanthanum.

Geriatric ConsiderationsIn initial studies, no overall clinical differences were noted in those >65 years old compared to younger adults.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were observed in some, but not all, animal studies. The effect on absorption of vitamins and nutrients has not been studied. Lanthanum is not recommended for use during pregnancy.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsReported in short-term (4-6 weeks) trials at frequency > placebo:

>10%:

Gastrointestinal: Nausea (11%), vomiting (9%), abdominal pain (5%)

Miscellaneous: Dialysis graft occlusion (8%)

1% to 10%: Endocrine & metabolic: Hypercalcemia was reported in longer-term trials at frequencies ≤4% (less frequently than with alternate therapy)

Note: Additional adverse effects noted in longer-term trials at rates higher than alternate therapy included constipation, diarrhea, and headache.

Drug InteractionsThere are no known significant interactions.
Test InteractionsAbdominal x-rays may have a radiopaque appearance.
Monitoring ParametersCalcium and phosphate levels
Reference RangeIn patients with stage 5 chronic kidney disease (ESRD) and those on hemodialysis or peritoneal dialysis, the serum phosphorus levels should be maintained between 3.5-5.5 mg/dL (1.13-1.78 mmol/L).
Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and potential interactions (See Drug Interactions). Assess blood pressure periodically. Can cause hypotension. Monitor laboratory tests, adverse reactions, and therapeutic response. **Pregnancy risk factor C:** Benefits of use should outweigh possible risks. Breast-feeding is not recommended
Monitoring: Lab TestsCalcium and phosphate levels
Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Chew tablets prior to swallowing. Maintain adequate hydration (2-3 L/day unless instructed to restrict intake by prescriber). You may experience dizziness or lightheadedness, (use caution when climbing stairs or changing position), headache, nausea, vomiting, diarrhea, abdominal pain, and constipation (increasing exercise, fluids, fruit/fiber may help). Report persistent dizziness, headache, nausea, vomiting, and diarrhea. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, chewable:

Fosrenol®: 500 mg, 750 mg, 1000 mg

Generic AvailableNo
ManufacturerShire
Pricing: U.S. (www.drugstore.com)

Chewable (Fosrenol)

500 mg (45): $273.23

1000 mg (30): $186.27

Mechanism of ActionDisassociates in the upper gastrointestinal tract to lanthanum ions (La^{3+}) which bind to dietary phosphate resulting in insoluble lanthanum phosphate complexes and a net decrease in serum phosphate and calcium levels.
Pharmacodynamics/Kinetics

Absorption: <0.002%

Protein binding: >99%

Metabolism: Not metabolized

Half-life elimination: Plasma: 53 hours; Bone: 2-3.6 years

Excretion: Feces primarily; urine <2%

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concurrent use with SSRIs, lithium, or valproic acid may produce additive GI effects; may bind with gabapentin; separate administration by at least 2 hours
Index TermsLanthanum Carbonate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lapatinib may be confused with dasatinib, erlotinib, imatinib

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(la PA ti nib)

U.S. Brand NamesTykerb®

Pharmacologic CategoryAntineoplastic Agent, Tyrosine Kinase Inhibitor; Epidermal Growth Factor Receptor (EGFR) Inhibitor

Use: Labeled IndicationsTreatment (in combination with capecitabine) of HER2/neu overexpressing advanced or metastatic breast cancer, in patients who have received prior therapy (with an anthracycline, a taxane, and trastuzumab)

Use: Unlabeled/InvestigationalTreatment of head and neck cancers

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted. **Note:** Dose reductions are likely to be needed when lapatinib is administered concomitantly with a strong CYP3A4 inhibitor (an alternate medication for CYP3A4 enzyme inhibitors should be investigated first).

Breast cancer: 1250 mg once daily (in combination with capecitabine)

Dosage adjustment for concomitant CYP3A4 inhibitors/inducers:

CYP3A4 inhibitors: Dose reductions are likely to be needed when lapatinib is administered concomitantly with a strong CYP3A4 inhibitor (an alternate medication for CYP3A4 enzyme inhibitors should be investigated first); in the event that lapatinib must be administered concomitantly with a potent enzyme inhibitor, consider reducing lapatinib to 500 mg once daily with careful monitoring. (When a strong CYP3A4 inhibitor is discontinued; allow ~1 week to elapse prior to adjusting the lapatinib dose upward.)

CYP3A4 inducers: Concomitant administration with CYP3A4 inducers may require increased lapatinib doses (alternatives to the enzyme-inducing agent should be utilized first); consider titrating gradually up to 4500 mg/day, with careful monitoring. (If the strong CYP3A4 enzyme inducer is discontinued, reduce the lapatinib dose to the indicated dose.)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot studied in renal dysfunction, however, due to the minimal renal elimination (<2%), dosage adjustments for renal dysfunction may not be necessary.

Dosing: Hepatic ImpairmentSevere hepatic impairment (Child-Pugh Class C): Consider a dose reduction to 750 mg once daily.

Dosing: Adjustment for Toxicity

Cardiac toxicity: Discontinue treatment for decreased LVEF ≥ grade 2 or LVEF < LLN; may be restarted after 2 weeks at 1000 mg once daily if LVEF recovers to normal and patient is asymptomatic

Other toxicities: Withhold for any toxicity (other than cardiac) ≥ grade 2 until toxicity resolves to ≤ grade 1; reduce dosage to 1000 mg once daily for persistent toxicity

Dosing: Combination Regimens

Breast cancer: Capecitabine + Lapatinib

Administration: OralAdminister once daily, on an empty stomach, 1 hour before or 1 hour after a meal. Take at the same time each day; dividing doses is not recommended.

Dietary ConsiderationsTake on an empty stomach, 1 hour before or 1 hour after a meal. (**Note:** For combination with capecitabine treatment, capecitabine should be taken with food, or within 30 minutes after a meal.)

StorageStore at room temperature of 25°C (77°F); excursions permitted between 15°C and 30°C (59°F and 86°F).

RestrictionsLapatinib is available **only** at specialty pharmacies through a restricted-access program, Tykerb® CARES. Information is available at www.tykerbcares.com or 1-866-489-5372.

ContraindicationsThere are no contraindications listed within the manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Hepatotoxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Diarrhea: Diarrhea is common, may be severe; manage with antidiarrheal agents; severe diarrhea may require hydration, electrolytes, and/or interruption of therapy.

- Hepatotoxicity: **[U.S. Boxed Warning]: Hepatotoxicity (ALT or AST >3 times ULN and total bilirubin >1.5 times ULN) has been reported with lapatinib; may be severe and/or fatal.** Onset may occur within days to several months after treatment initiation. Monitor; discontinue with severe changes in liver function; do not retreat.

- Left ventricular dysfunction: Decreases in left ventricular ejection fraction (LVEF) have been reported; baseline and periodic LVEF evaluations are recommended. Interrupt therapy or decrease dose with decreased LVEF ≥ grade 2 or LVEF < LLN.

- Pulmonary toxicity: Interstitial lung disease (ILD) and pneumonitis have been reported (with lapatinib monotherapy and combination chemotherapy); discontinue therapy for grade 3 (or higher) pulmonary symptoms indicative of ILD or pneumonitis (eg, dyspnea, dry cough).

- QT_c prolongation: QT_c prolongation has been observed; use caution in patients with a history of QT_c prolongation or with medications known to prolong the QT interval; baseline and periodic 12-lead ECG should be considered; correct electrolyte (potassium, calcium, and magnesium) abnormalities prior to and during treatment.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of or predisposed (prior treatment with anthracyclines, chest wall irradiation) to left ventricular dysfunction.

- Hepatic impairment: Use with caution in patients with hepatic dysfunction; dose reductions should be considered in patients with severe (Child-Pugh class C) hepatic impairment.

Concurrent drug therapy issues:

- High potential for interactions: Avoid use with strong CYP3A4 inhibitors or inducers (see Drug Interactions); if concomitant therapy cannot be avoided, lapatinib dosage adjustments should be considered.

- QT_c-prolonging agents: Concurrent use with other drugs which may prolong QT_c interval may increase the risk of potentially-fatal arrhythmias.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo differences in safety or effectiveness were observed between elderly and younger patients.
Pregnancy Risk FactorD
Pregnancy ConsiderationsIncreased pup deaths were demonstrated in animal studies. There are no adequate and well-controlled studies in pregnant women. Lapatinib may cause fetal harm if administered during pregnancy. Women of childbearing potential should be advised to avoid pregnancy during treatment.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions Percentages reported for combination chemotherapy.

>10%:

Central nervous system: Fatigue (10% to 18%)

Dermatologic: Palmar-plantar erythrodysesthesia (hand-and-foot syndrome) (53%; grade 3: 12%), rash (28%)

Gastrointestinal: Diarrhea (65%; grade 3: 13%; grade 4: 1%), nausea (44%), vomiting (26%), abdominal pain (15%), mucosal inflammation (15%), stomatitis (14%), dyspepsia (11%)

Hematologic: Anemia (56%; grade 3: <1%), neutropenia (22%; grade 3: 3%; grade 4: <1%), thrombocytopenia (18%; grade 3: <1%)

Hepatic: AST increased (49%; grade 3: 2%; grade 4: <1%), total bilirubin increased (45%; grade 3: 4%), ALT increased (37%; grade 3: 2%)

Neuromuscular & skeletal: Limb pain (12%), back pain (11%)

Respiratory: Dyspnea (12%)

1% to 10%:

Cardiovascular: LVEF decreased (grade 2: 2%; grade 3: <1%)

Central nervous system: Insomnia (10%)

Dermatologic: Dry skin (10%)

<1%, postmarketing, and/or case reports: Hepatotoxicity, interstitial lung disease, pneumonitis, Prinzmetal's angina, QT_c prolongation

Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP2C8 (minor), 3A4 (major), P-glycoprotein (P-gp, ABCB1); **Inhibits** CYP2C8, 3A4
Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Systemic exposure of lapatinib is increased when administered with food (AUC three- to fourfold higher). Avoid grapefruit juice (may increase the levels/effects of lapatinib).

Herb/Nutraceutical: Avoid St John's wort (may increase metabolism and decrease lapatinib concentrations).

Monitoring ParametersLVEF (baseline and periodic), CBC with differential, liver function tests, including transaminases, bilirubin, and alkaline phosphatase (baseline and every 4-6 weeks during treatment); electrolytes including calcium, potassium, magnesium; monitor for fluid retention; ECG monitoring if at risk for QT_c prolongation; symptoms of ILD

Nursing: Physical Assessment/MonitoringUse caution in presence of hepatic or left ventricular dysfunction. Assess all other pharmacological or herbal products patient may be taking for potential adverse interactions (anything that may prolong QT interval or strong

CYP3A4 inducers or inhibitors); dose adjustment may be necessary. Evaluate results of laboratory tests at baseline and on a regular basis (eg, CBC, LFTs, electrolytes, left ventricular ejection fraction). Assess therapeutic effectiveness and adverse reactions periodically during therapy (eg, cardiac changes, gastrointestinal disturbance [diarrhea may become severe], pulmonary status [interstitial lung disease or pneumonitis]). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, liver function tests, including transaminases, bilirubin, and alkaline phosphatase (baseline and every 4-6 weeks during treatment); electrolytes including calcium, potassium, magnesium

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take as directed on an empty stomach 1 hour before or 1 hour after a meal. Avoid grapefruit or grapefruit juice while taking this medication. Maintain adequate hydration (2-3 L/day) unless instructed to restrict fluid intake. You may be required to have regularly scheduled laboratory tests while on this medication. You will be more susceptible to infection (avoid crowds and exposure to infection and do not receive any vaccination unless approved by prescriber). You may experience diarrhea (buttermilk, boiled milk, or yogurt may reduce diarrhea; contact prescriber if persistent or severe); insomnia or fatigue (use caution when driving or engaging in hazardous tasks until response to drug is known); nausea, vomiting, stomach pain, or dyspepsia (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or red, painful hands, feet, limb, or back pain (contact prescriber for appropriate analgesia). Report chest pain or palpitations; any unusual cough, respiratory difficulty, or wheezing; easy bruising or unusual bleeding; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant. Consult prescriber for appropriate contraception while using this medication. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Tykerb®: 250 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablets (Tykerb)

250 mg (150): $3604.11

Mechanism of ActionTyrosine kinase (dual kinase) inhibitor; inhibitor of EGFR (ErbB1) and HER2 (ErbB2) by reversibly binding to tyrosine kinase, blocking phosphorylation and activation of downstream second messengers (Erk1/2 and Akt), regulating cellular proliferation and survival in ErbB- and ErbB2-expressing tumors.

Pharmacodynamics/Kinetics

Absorption: Incomplete and variable

Protein binding: >99% to albumin and alpha$_1$-acid glycoprotein

Metabolism: Hepatic; extensive via CYP3A4 and 3A5, and to a lesser extent via CYP2C19 and 2C8 to oxidized metabolites

Half-life elimination: ~24 hours

Time to peak, plasma: 3-6 hours

Excretion: Feces (27% as unchanged drug; range 3% to 67%); urine (<2%)

Related Information

- Common Toxicity Criteria
- Management of Nausea and Vomiting

Pharmacotherapy Pearls**Oncology Comment:** The National Comprehensive Cancer Network (NCCN) breast cancer guidelines list lapatinib (in combination with capecitabine) as an option for the treatment of HER2-positive breast cancer in patients who are refractory to anthracycline, taxane and trastuzumab treatment. In a randomized phase III study (Geyer, 2006) of lapatinib plus capecitabine versus capecitabine alone in HER2-positive advanced breast cancer, the addition of lapatinib was associated with a 51% reduction in the risk of disease progression in heavily pretreated patients. Lapatinib shows activity in HER2-positive metastatic breast cancer that has progressed after trastuzumab treatment.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsLapatinib is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusFatigue is common; may cause insomnia

Mental Health: Effects on Psychiatric TreatmentDiarrhea is common; concurrent use with SSRIs or lithium may produce additive effects. May prolong QT$_c$ interval; concurrent use with ziprasidone, paliperidone, and thioridazine is not recommended. Hematologic side effects are common; use caution with clozapine, carbamazepine, and valproic acid. Lapatinib is a CYP3A4 substrate and inhibitor. CYP3A4 inducers (St John's wort, carbamazepine, barbiturates) may decrease the levels/effects of lapatinib. The effects/levels of CYP3A4 substrates (benzodiazepines, mirtazapine, venlafaxine, and nefazodone) may be increased by lapatinib. Selected benzodiazepines (midazolam, triazolam), and pimozide are generally contraindicated with strong CYP3A4 inhibitors.

Pronunciation(lair OH ni days)

U.S. Brand NamesAldurazyme®

Canadian Brand NamesAldurazyme®

Pharmacologic CategoryEnzyme

Use: Labeled IndicationsTreatment of Hurler and Hurler-Scheie forms of mucopolysaccharidosis I (MPS I); treatment of Scheie form of MPS I in patients with moderate to severe symptoms

Dosing: Adults**Note:** Premedicate with antipyretic and/or antihistamines 1 hour prior to start of infusion.

MPS I (Hurler syndrome, Hurler-Scheie, and Scheie forms): I.V.: 0.58 mg/kg once weekly; dose should be rounded up to the nearest whole vial

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Premedicate with antipyretic and/or antihistamines 1 hour prior to start of infusion.

MPS I (Hurler syndrome, Hurler-Scheie, and Scheie forms): Children ≥5 years: I.V.: 0.58 mg/kg once weekly; dose should be rounded up to the nearest whole vial

Administration: I.V.Administer using PVC container and PVC infusion set with in-line, low protein-binding 0.2 micrometer filter. Antipyretics and/or antihistamines should be administered prior to infusion. Volume and infusion rate are based on body weight. Vital signs should be monitored every 15 minutes, if stable; rate may be increased as follows:

- ≤20 kg: Total infusion volume: 100 mL
  - 2 mL/hour for 15 minutes
  - 4 mL/hour for 15 minutes
  - 8 mL/hour for 15 minutes
  - 16 mL/hour for 15 minutes
  - 32 mL/hour for remainder of infusion
- >20 kg: Total infusion volume: 250 mL
  - 5 mL/hour for 15 minutes
  - 10 mL/hour for 15 minutes
  - 20 mL/hour for 15 minutes
  - 40 mL/hour for 15 minutes
  - 80 mL/hour for remainder of infusion

Note: In case of infusion-related reaction, decrease the rate of infusion, temporarily discontinue the infusion, and/or administer additional antipyretics/antihistamines.

StorageStore vials under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake. Following dilution, solution for infusion should be used immediately; however, if not used immediately, refrigerate. Infusion of solution should be completed within 36 hours of preparation.

ReconstitutionSolution should be prepared based on body weight and should begin by making a solution of NS and albumin 0.1%.

≤20 kg: Using NS 100 mL PVC bag and albumin (human) [2 mL of albumin 5% or 0.4 mL of albumin 25%]:

Remove and discard a volume of NS equal to the amount of albumin to be added to the infusion bag. Add albumin; the total volume of this solution should equal 100 mL. From this bag, remove and discard an equal volume of the laronidase to be added (based on calculated dose). Slowly withdraw and add laronidase to the NS/albumin 0.1% solution; avoid excessive agitation, do not use filtered syringe. Gently rotate infusion bag to mix (do not shake).

>20 kg: Using NS 250 mL PVC bag and albumin (human) [5 mL of albumin 5% or 1 mL of albumin 25%]:

Remove and discard a volume of NS equal to the amount of albumin to be added to the infusion bag. Add albumin; the total volume of this solution should equal 250 mL. From this bag, remove and discard an equal volume of the laronidase to be added (based on calculated dose). Slowly withdraw and add laronidase to the NS/albumin 0.1% solution; avoid excessive agitation, do not use filtered syringe. Gently rotate infusion bag to mix (do not shake).

CompatibilityStable in NS.

ContraindicationsThere are no contraindications listed within the manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Anaphylaxis/infusion reactions: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Anaphylaxis/infusion reactions: **[U.S. Boxed Warning]: Anaphylactic reactions have been observed during infusion, immediate treatment for hypersensitivity reactions should be available during administration. Additional monitoring may be required in patients with compromised respiratory function or acute respiratory disease; may be at increased risk for acute exacerbation of respiratory symptoms due to infusion reaction.** Patients with acute illness may also be at increased risk for infusion reactions. Reactions, which may include airway obstruction, bradycardia, bronchospasm, hypotension, hypoxia, respiratory distress/failure, stridor, tachypnea, and urticaria, may be severe and tend to occur during or within 3 hours after administration. Antipyretics and or antihistamines should be administered prior to infusion to reduce the incidence/severity of headache, fever, and/or flushing. In event of reaction, decrease the rate of infusion, temporarily discontinue the infusion, and/or administer additional antipyretics/antihistamines. Risks and benefits should be carefully considered prior to readministering following a severe hypersensitivity reaction. In the case of anaphylaxis, caution should be used if epinephrine is being considered; many patients with MPS I have pre-existing heart disease.

Disease-related concerns:

- MPS I: Appropriate use: Has not been studied in patients with mild symptoms of the Scheie form of MPS I. Not indicated for the CNS manifestations of the disorder.

Special populations:

- Pediatrics: Studies did not include children <5 years of age.

Dosage form specific issues:

- Albumin: Prepared infusions contain human albumin.

Other warnings/precautions:

- Registry: A patient registry has been established and all patients are encouraged to participate. Registry information may be obtained at www.MPSIregistry.com or by calling 800-745-4447.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, there are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed. Patients are encouraged to enroll in the MPS I registry.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsPatients are encouraged to enroll in the MPS I registry.

Adverse Reactions**Note:** Percentages reported are from a placebo-controlled study (45 patients, 22 receiving laronidase).

>10%:

Cardiovascular: Vein disorder (14%)

Dermatologic: Rash (36%)

Local: Injection site reaction (18%)

Neuromuscular & skeletal: Hyper-reflexia (14%), paresthesia (14%)

Respiratory: Upper respiratory tract infection (32%)

Miscellaneous: Antibody development to laronidase (91%); infusion reactions (32%; may be severe; includes flushing [23%], fever, and headache; frequency decreased over time during open-label extension period)

1% to 10%:

Cardiovascular: Chest pain (9%), edema (9%), facial edema (9%), hypotension (9%)

Hematologic: Thrombocytopenia (9%)

Hepatic: Bilirubinemia (9%)

Local: Abscess (9%), injection site pain (9%)

Ocular: Corneal opacity (9%)

Miscellaneous: Allergic reaction (severe/serious: 1%)

<1%, postmarketing, and/or case reports: Abdominal pain, airway obstruction, anaphylaxis, angioedema, arthralgia, bronchospasm, chills, cough, diarrhea, dyspnea, hypersensitivity, hypertension, nausea, oxygen saturation decreased, pruritus, tachycardia, urticaria, vomiting

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersVital signs; injection site reactions, infusion reactions

Nursing: Physical Assessment/MonitoringNote administration and reconstitution specifics. Antipyretics and or antihistamines should be administered prior to infusion to reduce incidence/severity of reaction (headache, fever, flushing). Patient must be closely monitored for infusion reactions during and after every infusion (reactions may be severe and usually occur within 3 hours of infusion). Encourage patient to enroll in patient registry for this medication. Teach possible side effects, appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication will not cure your form of mucopolysaccharidosis, but rather may help reduce the symptoms. This medication can only be administered by intravenous infusion. You will be monitored during and after each infusion. Report immediately any chest pain, throat tightness, difficulty breathing, chills, fever, vomiting, or acute headache at time of infusion. Report any chest pain, upper respiratory infection, infusion site redness or swelling, or other adverse reactions that occur between infusions. **Breast-feeding precaution:** Consult prescriber if you are or intend to breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Aldurazyme®: 2.9 mg/5 mL (5 mL) [contains polysorbate 80; derived from Chinese hamster cells]

Generic AvailableNo

ManufacturerBioMarin Pharmaceutical Inc

Mechanism of ActionLaronidase is a recombinant (replacement) form of α-L-iduronidase derived from Chinese hamster cells. α-L-iduronidase is an enzyme needed to break down endogenous glycosaminoglycans (GAGs) within lysosomes. A deficiency of α-L-iduronidase leads to an accumulation of GAGs, causing cellular, tissue, and organ dysfunction as seen in MPS I. Improved pulmonary function and walking capacity have been demonstrated with the administration of laronidase to patients with Hurler, Hurler-Scheie, or Scheie (with moderate to severe symptoms) forms of MPS.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.24-0.6 L/kg

Half-life elimination: 1.5-3.6 hours

Excretion: Clearance: 1.7 to 2.7 mL/minute/kg; during the first 12 weeks of therapy the clearance of laronidase increases proportionally to the amount of antibodies a given patient develops against the enzyme. However, with long-term use (≥26 weeks) antibody titers have no effect on laronidase clearance.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsRecombinant α-L-Iduronidase (Glycosaminoglycan α-L-Iduronohydrolase)

Latanoprost

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Xalatan® may be confused with Travatan®, Zarontin®

Pronunciation(la TA noe prost)
U.S. Brand NamesXalatan®
Canadian Brand NamesXalatan®
Pharmacologic CategoryOphthalmic Agent, Antiglaucoma; Prostaglandin, Ophthalmic
Use: Labeled IndicationsReduction of elevated intraocular pressure in patients with open-angle glaucoma or ocular hypertension
Dosing: AdultsGlaucoma: Ophthalmic: 1 drop (1.5 mcg) in the affected eye(s) once daily in the evening; do not exceed the once daily dosage because it has been shown that more frequent administration may decrease the IOP lowering effect

Note: A medication delivery device (Xal-Ease™) is available for use with Xalatan®.

Dosing: ElderlyRefer to adult dosing.
Administration: OtherIf more than one topical ophthalmic drug is being used, administer the drugs at least 5 minutes apart. A delivery aid, Xal-Ease™, is available for administering Xalatan®.
StorageStore intact bottles under refrigeration (2°C to 8°C/36°F to 46°F). Protect from light. Once opened, the container may be stored at room temperature up to 25°C (77°F) for 6 weeks.
ContraindicationsHypersensitivity to latanoprost or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Bacterial keratitis: Inadvertent contamination of multiple-dose ophthalmic solutions, has caused bacterial keratitis.
- Ocular effects: May permanently change/increase brown pigmentation of the iris, the eyelid skin, and eyelashes. In addition, may increase the length and/or number of eyelashes (may vary between eyes); changes occur slowly and may not be noticeable for months or years. Long-term consequences and potential injury to eye are not known.

Disease-related concerns:

- Ocular disease: Use with caution in patients with intraocular inflammation, aphakic patients, pseudophakic patients with a torn posterior lens capsule, or patients with risk factors for macular edema. Safety and efficacy have not been determined for use in patients with angle-closure-, inflammatory-, or neovascular glaucoma.

Special populations:

- Contact lens wearers: Contains benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.

Geriatric ConsiderationsEvaluate patient's ability to self-administer eye drops
Pregnancy Risk FactorC
Adverse Reactions

>10%: Ocular: Blurred vision, burning and stinging, conjunctival hyperemia, foreign body sensation, itching, increased pigmentation of the iris, and punctate epithelial keratopathy

1% to 10%:

Cardiovascular: Chest pain, angina pectoris

Dermatologic: Rash, allergic skin reaction

Neuromuscular & skeletal: Myalgia, arthralgia, back pain

Ocular: Dry eye, excessive tearing, eye pain, lid crusting, lid edema, lid erythema, lid discomfort/pain, photophobia

Respiratory: Upper respiratory tract infection, cold, flu

<1%: Conjunctivitis, diplopia, discharge from the eye, retinal artery embolus, retinal detachment, vitreous hemorrhage from diabetic retinopathy

Postmarketing and/or case reports: Asthma, corneal edema, corneal erosion, dyspnea, eyelash change, eyelid skin darkening, herpes keratitis, iritis, keratitis, macular edema, toxic epidermal necrolysis, uveitis

Drug Interactions

Bimatoprost: The concomitant use of Latanoprost and Bimatoprost may result in increased intraocular pressure. *Risk D: Consider therapy modification*

NSAID (Ophthalmic): May diminish the therapeutic effect of Latanoprost. *Risk C: Monitor therapy*

Nursing: Physical Assessment/Monitoring Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects (eg, blurred vision, burning and stinging, conjunctival hyperemia, foreign body sensation, itching, increased pigmentation of the iris, and punctate epithelial keratopathy). Teach patient proper use, side effects/appropriate interventions, and symptoms to report.

Patient Education For use in eyes only. Iris color may change because of an increase of the brown pigment (cosmetically different eye coloration that may occur). Iris pigmentation changes may be more noticeable in patients with green-brown, blue/gray-brown, or yellow-brown irides. If any ocular reaction develops, particularly conjunctivitis and lid reactions, immediately notify prescriber. If more than one topical ophthalmic drug is being used, administer the drugs at least 5 minutes apart. Latanoprost contains benzalkonium chloride, which may be absorbed by contact lenses. Remove contact lenses prior to administration; lenses may be reinserted after 15 minutes. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Serious damage to the eye and subsequent loss of vision may result from using contaminated solutions. A delivery aid, Xal-Ease™, is available for administering Xalatan®. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: 0.005% (2.5 mL) [contains benzalkonium chloride]

Generic Available No

Pricing: U.S. (www.drugstore.com)

Solution (Xalatan)

0.005% (2.5): $85.86

Mechanism of Action Latanoprost is a prostaglandin F_2-alpha analog believed to reduce intraocular pressure by increasing the outflow of the aqueous humor

Pharmacodynamics/Kinetics

Onset of action: 3-4 hours

Peak effect: Maximum: 8-12 hours

Absorption: Through the cornea where the isopropyl ester prodrug is hydrolyzed by esterases to the biologically active acid. Peak concentration is reached in 2 hours after topical administration in the aqueous humor.

Distribution: V_d: 0.16 L/kg

Metabolism: Primarily hepatic via fatty acid beta-oxidation

Half-life elimination: 17 minutes

Excretion: Urine (as metabolites)

Related Information

Leflunomide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(le FLOO noh mide)

U.S. Brand NamesArava®

Canadian Brand NamesApo-Leflunomide®; Arava®; DOM-Leflunomide; GEN-Leflunomide; NOVO-Leflunomide; PHL-Leflunomide; PMS-Leflunomide; SANDOZ-Leflunomide

Pharmacologic CategoryAntirheumatic, Disease Modifying

Use: Labeled IndicationsTreatment of active rheumatoid arthritis; indicated to reduce signs and symptoms, and to retard structural damage and improve physical function

Orphan drug: Prevention of acute and chronic rejection in recipients of solid organ transplants

Use: Unlabeled/InvestigationalTreatment of cytomegalovirus (CMV) disease

Dosing: Adults

Rheumatoid arthritis: Oral: Loading dose: 100 mg/day for 3 days, followed by 20 mg/day; **Note:** May be omitted in patients at increased risk of hepatic or hematologic toxicity (eg, recent concomitant methotrexate). Dosage may be decreased to 10 mg/day in patients who have difficulty tolerating the 20 mg dose. Due to the long half-life of the active metabolite, plasma levels may require a prolonged period to decline after dosage reduction.

CMV (unlabeled): Some authors recommend 200 mg daily for 7 days, followed by 40-60 mg/day targeting blood levels of 100 mcg/mL. Others have utilized the standard arthritis dosing.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo specific dosage adjustment is recommended. There is no clinical experience in the use of leflunomide in patients with renal impairment. The free fraction of MI is doubled in dialysis patients. Patients should be monitored closely for adverse effects requiring dosage adjustment.

Dosing: Hepatic ImpairmentNo specific dosage adjustment is recommended; not recommended for use in patients with significant hepatic impairment. Since the liver is involved in metabolic activation and subsequent metabolism/elimination of leflunomide, patients with hepatic impairment should be monitored closely for adverse effects requiring dosage adjustment.

Dosing adjustment in hepatic toxicity: Guidelines for dosage adjustment or discontinuation based on the severity and persistence of ALT elevation secondary to leflunomide have been developed. If ALT elevations >2 times but ≤3 times ULN are noted, reduce dose to 10 mg/day, and monitor closely. If elevations persist or if elevations >3 times ULN are observed, discontinue leflunomide and initiate protocol to accelerate elimination. Cholestyramine (8 g 3 times/day for 1-3 days) or activated charcoal (50 g every 6 hours for 24 hours) may be administered to decrease leflunomide concentrations rapidly. If elevations >3 times ULN persist additional cholestyramine and/or activated charcoal may be required.

Dosing: Adjustment for ToxicityHepatic toxicity: Guidelines for dosage adjustment or discontinuation based on the severity and persistence of ALT elevation secondary to leflunomide have been developed. If ALT elevations >2 times but ≤3 times ULN are noted, reduce dose to 10 mg/day, and monitor closely. If elevations persist or if elevations >3 times ULN are observed, discontinue leflunomide and initiate protocol to accelerate elimination. Cholestyramine (8 g 3 times/day for 1-3 days) or activated charcoal (50 g every 6 hours for 24 hours) may be administered to decrease leflunomide concentrations rapidly. If elevations >3 times ULN persist additional cholestyramine and/or activated charcoal may be required.

Dietary ConsiderationsAdminister without regard to meals.

StorageStore at 25°C (77°F). Protect from light.

ContraindicationsHypersensitivity to leflunomide or any component of the formulation; pregnancy

Allergy Considerations

- Leflunomide Allergy

Warnings/Precautions

Boxed warnings:

- Women of childbearing potential: See “Special populations” below.

Concerns related to adverse effects:

- Dermatologic reactions: Rare cases of dermatologic reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis) have been reported; discontinue if evidence or severe dermatologic reaction occurs, and begin procedure to accelerate elimination (cholestyramine or activated charcoal).

- Hepatotoxicity: Use has been associated with rare reports of hepatotoxicity, hepatic failure, and death. Multiple risk factors for hepatotoxicity including hepatic disease (including seropositive hepatitis B or C patients) and/or concurrent exposure to other hepatotoxins may increase the risk of hepatotoxicity. Most severe cases occur within 6 months of initiation; monitoring of hepatic function is required.

- Immunosuppression: May increase susceptibility to infection, including opportunistic pathogens. Severe infections, sepsis, and fatalities have been reported.

- Infections: Caution should be exercised when considering the use in patients with a history of new/recurrent infections, with conditions that predispose them to infections, or with chronic, latent, or localized infections. Patients who develop a new infection while undergoing treatment should be monitored closely. If a patient develops a serious infection, therapy should be discontinued and drug elimination procedures initiated.

- Interstitial lung disease: Use has been associated (rarely) with interstitial lung disease; discontinue in patients who develop new onset or worsening of pulmonary symptoms. Accelerated elimination procedures should be considered if interstitial lung disease occurs; fatal outcomes have been reported.

- Malignancy: Use may affect defenses against malignancies; impact on the development and course of malignancies is not fully defined. As compared to the general population, an increased risk of lymphoma has been noted in clinical trials; however, rheumatoid arthritis has been previously associated with an increased rate of lymphoma.

Disease-related concerns:

- Hematologic disorders: Use with caution in patients with a prior history of significant hematologic abnormalities including bone marrow dysplasia; use has been associated with rare pancytopenia, agranulocytosis, and thrombocytopenia, particularly when given in combination with methotrexate or other immunosuppressive agents. Monitoring of hematologic function is required; discontinue if evidence of bone marrow suppression and begin procedure to accelerate elimination (cholestyramine or activated charcoal).

- Hepatic disease: Due to risk of toxicity, use in patients with hepatic impairment or evidence of hepatitis B or C is not recommended.

- Renal impairment: Use with caution in patients with renal impairment; will increase uric acid excretion.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Women of childbearing potential: **[U.S. Boxed Warning]: Women of childbearing potential should not receive therapy until pregnancy has been excluded, they have been counseled concerning fetal risk and reliable contraceptive measures have been confirmed.**

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy. Live vaccines should not be given concurrently; there is no data available concerning secondary transmission of live vaccines in patients receiving therapy.

Geriatric ConsiderationsIn Phase III studies, no difference in safety and effectiveness were seen between older and younger adults. No dosage reduction necessary based on age alone; monitor in renal and hepatic impairment.

Pregnancy Risk FactorX

Pregnancy ConsiderationsHas been associated with teratogenic and embryolethal effects in animal models at low doses. Leflunomide is contraindicated in pregnant women or women of childbearing potential who are not using reliable contraception. Pregnancy must be excluded prior to initiating treatment. **[U.S. Boxed Warning]: Women of childbearing potential should not receive therapy until pregnancy has been excluded, they have been counseled concerning fetal risk, and reliable contraceptive measures have been confirmed.** Following treatment, pregnancy should be avoided until undetectable plasma levels (<0.02 mcg/mL) are verified. This may be accomplished by an extended drug elimination procedure: Administer cholestyramine 8 g 3 times/day for 11 days (the 11 days do not need to be consecutive). Plasma levels <0.02 mg/L should be verified by two separate tests performed at least 14 days apart. If plasma levels are >0.02 mg/L, additional cholestyramine treatment should be considered. Pregnant women exposed to leflunomide should be registered with the pregnancy registry (877-311-8972).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsIt is not known whether leflunomide is secreted in human milk. Because many immunoglobulins are secreted in milk, and the potential for serious adverse reactions exists, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse Reactions

>10%:

Gastrointestinal: Diarrhea (17%)

Respiratory: Respiratory tract infection (15%)

1% to 10%:

Cardiovascular: Hypertension (10%), chest pain (2%), palpitation, tachycardia, vasodilation, varicose vein, edema (peripheral)

Central nervous system: Headache (7%), dizziness (4%), pain (2%), fever, malaise, migraine, anxiety, depression, insomnia, sleep disorder

Dermatologic: Alopecia (10%), rash (10%), pruritus (4%), dry skin (2%), eczema (2%), acne, dermatitis, hair discoloration, hematoma, nail disorder, subcutaneous nodule, skin disorder/discoloration, skin ulcer, bruising

Endocrine & metabolic: Hypokalemia (1%), diabetes mellitus, hyperglycemia, hyperlipidemia, hyperthyroidism, menstrual disorder

Gastrointestinal: Nausea (9%), abdominal pain (5%), dyspepsia (5%), weight loss (4%), anorexia (3%), gastroenteritis (3%), stomatitis (3%), vomiting (3%), cholelithiasis, colitis, constipation, esophagitis, flatulence, gastritis, gingivitis, melena, candidiasis (oral), enlarged salivary gland, tooth disorder, xerostomia, taste disturbance

Genitourinary: Urinary tract infection (5%), albuminuria, cystitis, dysuria, hematuria, vaginal candidiasis, prostate disorder, urinary frequency

Hematologic: Anemia

Hepatic: Abnormal LFTs (5%)

Neuromuscular & skeletal: Back pain (5%), joint disorder (4%), weakness (3%), tenosynovitis (3%), synovitis (2%), paresthesia (2%), arthralgia (1%), muscle cramps (1%), neck pain, pelvic pain, CPK increased, arthrosis, bursitis, myalgia, bone necrosis, bone pain, tendon rupture, neuralgia, neuritis

Ocular: Blurred vision, cataract, conjunctivitis, eye disorder

Respiratory: Bronchitis (7%), cough (3%), pharyngitis (3%), pneumonia (2%), rhinitis (2%), sinusitis (2%), asthma, dyspnea, epistaxis

Miscellaneous: Accidental injury (5%), infection (4%), allergic reactions (2%), diaphoresis, herpes infection

<1%, postmarketing and/or case reports: Agranulocytosis, anaphylaxis, angioedema, cholestasis, cutaneous necrotizing vasculitis, eosinophilia, erythema multiforme; hepatotoxicity (rare, including hepatic necrosis and hepatic failure, some fatalities reported); interstitial lung disease, leukopenia, opportunistic infection, pancreatitis, pancytopenia, peripheral neuropathy, pneumonitis (interstitial), pulmonary fibrosis, sepsis, Stevens-Johnson syndrome, thrombocytopenia, toxic epidermal necrolysis, urticaria, vasculitis

Metabolism/Transport Effects**Inhibits** CYP2C9 (weak)

Drug Interactions

Methotrexate: May enhance the myelosuppressive effect of Leflunomide. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Leflunomide may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: No interactions with food have been noted.

Monitoring ParametersA complete blood count (WBC, hemoglobin, hematocrit, and platelet count), serum phosphate, as well as serum transaminase determinations should be monitored at baseline and monthly during the initial 6 months of treatment; if stable, monitoring frequency may be decreased to every 6-8 weeks thereafter (continue monthly when used in combination with other immunosuppressive agents). In addition, monitor for signs/symptoms of severe infection, abnormalities in hepatic function tests, or symptoms of hepatotoxicity. If coadministered with methotrexate, monthly transaminase and serum albumin levels are recommended.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions. Do not administer live vaccines. Monitor for signs and symptoms of severe infection, hypertension, or hepatic dysfunction. Monitor for new onset or worsening of pulmonary symptoms. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to sexually-active female patients unless capable of complying with contraceptive use. Breast-feeding is contraindicated.

Monitoring: Lab TestsA complete blood count (WBC, hemoglobin, hematocrit, and platelet count), serum phosphate, as well as serum transaminase determinations, should be monitored at baseline and monthly during the initial 6 months of treatment; if stable, monitoring frequency may be decreased to every 6-8 weeks thereafter (continue monthly when used in combination with other immunosuppressive agents). If coadministered with methotrexate, monthly transaminase and serum albumin levels are recommended.

Patient EducationTake as directed; do not increase dose without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Store medication away from light. Do not receive any vaccinations unless approved by prescriber. You may experience diarrhea (buttermilk, boiled milk, or yogurt may help); nausea, vomiting, loss of appetite, and flatulence (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). If you have diabetes, monitor blood sugars closely; this medication may alter glucose levels. If you experience symptoms such as nausea, vomiting, stomach pain or swelling, jaundice, dark urine, or unusual tiredness, report these to your prescriber **immediately**. Report chest pain, palpitations, rapid heartbeat, or swelling of extremities; persistent GI problems; skin rash, mucous membrane lesions, redness, irritation, acne, ulcers; frequent, painful, or difficult urination, or genital itching or irritation; depression, acute headache, anxiety, or difficulty sleeping; muscle tremors, cramping or weakness, back pain, or altered gait; cough, cold symptoms, wheezing, or respiratory difficulty; easy bruising/bleeding; blood in vomitus, stool, urine; or other unusual effects related to this medication. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Do not get pregnant or have sex unless using appropriate contraception while on this medication. This drug may cause severe fetal defects. Consult prescriber if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet (Arava®): 10 mg, 20 mg

Generic AvailableYes

ManufacturerHoechst-Marion Roussel

Pricing: U.S. (www.drugstore.com)

Tablets (Arava)

10 mg (30): $546.20

20 mg (30): $569.99

Tablets (Leflunomide)

10 mg (30): $64.00

20 mg (30): $40.01

Mechanism of ActionInhibits pyrimidine synthesis, resulting in antiproliferative and anti-inflammatory effects. For CMV, may interfere with virion assembly.

Pharmacodynamics/Kinetics

Distribution: V_d: 0.13 L/kg

Metabolism: Hepatic to A77 1726 (MI) which accounts for nearly all pharmacologic activity; further metabolism to multiple inactive metabolites; undergoes enterohepatic recirculation

Bioavailability: 80%

Half-life elimination: Mean: 14-15 days; enterohepatic recycling appears to contribute to the long half-life of this agent, since activated charcoal and cholestyramine substantially reduce plasma half-life

Time to peak: 6-12 hours

Excretion: Feces (48%); urine (43%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), stomatitis, oral candidiasis, abnormal taste, tooth disorder, enlarged salivary gland, esophagitis, and gingivitis.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness, malaise, anxiety, depression, or insomnia
Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia, caution with clozapine and carbamazepine

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(le na LID oh mide)

U.S. Brand NamesRevlimid®

Canadian Brand NamesRevlimid®

Pharmacologic CategoryAngiogenesis Inhibitor; Antineoplastic Agent; Immunomodulator, Systemic

Use: Labeled IndicationsTreatment of myelodysplastic syndrome (MDS) in patients with deletion 5q (del 5q) cytogenetic abnormality; treatment of multiple myeloma

Use: Unlabeled/InvestigationalTreatment of metastatic malignant melanoma; treatment of myelofibrosis

Dosing: Adults

Myelodysplastic syndrome (MDS): Oral: 10 mg once daily

Multiple myeloma: 25 mg once daily for 21 days of a 28-day treatment cycle (in combination with dexamethasone)

Metastatic malignant melanoma (unlabeled/investigational use): 10-25 mg once daily

Myelofibrosis (unlabeled/investigational use): Oral: 5-10 mg once daily

Dosing: ElderlyRefer to adult dosing. Due to the potential for decreased renal function in the elderly, select dose carefully and closely monitor renal function.

Dosing: Renal ImpairmentSelect dose carefully and closely monitor renal function. The FDA-approved labeling does not contain renal dosing adjustment guidelines. Lenalidomide AUC is increased 56% in multiple myeloma patients with mild renal impairment. Consider dose reductions in patients with renal dysfunction. Lenalidomide use with renal dysfunction has been studied in a limited number of patients with the following initial dosage recommendations (Chen, 2007):

MDS:

- Cl_{cr} 30-49 mL/minute: 5 mg once daily
- Cl_{cr} <30 mL/minute (nondialysis dependent): 5 mg every 48 hours
- Cl_{cr} <30 mL/minute (dialysis dependent): 5 mg 3 times/week (administer following dialysis)

Multiple myeloma:

- Cl_{cr} 30-49 mL/minute: 10 mg once daily (may increase to 15 mg once daily for inadequate treatment response after 2 cycles)
- Cl_{cr} <30 mL/minute (nondialysis dependent): 15 mg every 48 hours
- Cl_{cr} <30 mL/minute (dialysis dependent): 15 mg 3 times/week (administer following dialysis)

Dosing: Adjustment for Toxicity

Adjustment for thrombocytopenia in MDS:

Thrombocytopenia developing within 4 weeks of beginning treatment at 10 mg/day:

- Baseline platelets ≥100,000/mm^3:
  - If platelets <50,000/mm^3: Hold treatment
  - When platelets return to ≥50,000/mm^3: Resume treatment at 5 mg/day
- Baseline platelets <100,000/mm^3:
  - If platelets fall to 50% of baseline: Hold treatment
  - If baseline ≥60,000/mm^3 and platelet level returns to ≥50,000/mm^3: Resume at 5 mg/day
  - If baseline <60,000/mm^3 and platelet level returns to ≥30,000/mm^3: Resume at 5 mg/day

Thrombocytopenia developing after 4 weeks of beginning treatment at 10 mg/day:

Platelets <30,000/mm^3 **or** <50,000/mm^3 with platelet transfusions: Hold treatment

Platelets ≥30,000/mm^3 (without hemostatic failure): Resume at 5 mg/day

Thrombocytopenia developing with treatment at 5 mg/day:

Platelets <30,000/mm^3 **or** <50,000/mm^3 with platelet transfusions: Hold treatment

Platelets ≥30,000/mm^3 (without hemostatic failure): Resume at 5 mg every other day day

Adjustment for neutropenia in MDS:

Neutropenia developing within 4 weeks of beginning treatment at 10 mg/day:

For baseline absolute neutrophil count (ANC) ≥1000/mm^3:

ANC <750/mm^3: Hold treatment

When ANC returns to ≥1000/mm^3: Resume at 5 mg/day

For baseline absolute neutrophil count (ANC) <1000/mm^3:

ANC <500/mm^3: Hold treatment

When ANC returns to ≥500/mm^3: Resume at 5 mg/day

Neutropenia developing after 4 weeks of beginning treatment at 10 mg/day:

ANC <500/mm^3 for ≥7 days or associated with fever: Hold treatment

When ≥500/mm^3: Resume at 5 mg/day

Neutropenia developing with treatment at 5 mg/day:

ANC <500/mm^3 for ≥7 days or associated with fever: Hold treatment

When ≥500/mm^3: Resume at 5 mg every other day

Adjustment for thrombocytopenia in multiple myeloma:

Platelets <30,000/mm^3: Hold treatment, check CBC weekly

When platelets ≥30,000/mm^3: Resume at 15 mg daily

Additional occurrence of platelets <30,000/mm^3: Hold treatment

When platelets ≥30,000/mm^3: Resume treatment at 5 mg below previous dose; do not dose below 5 mg daily

Adjustment for neutropenia in multiple myeloma:

ANC <1000/mm^3: Hold treatment, add G-CSF, check CBC weekly

When ≥1000/mm^3 (with neutropenia as only toxicity): Resume at 25 mg/day

When ≥1000/mm^3 (with additional toxicities): Resume at 15 mg/day

Additional occurrence of ANC <1000/mm^3: Hold treatment

When ≥1000/mm^3: Resume treatment at 5 mg below previous dose; do not dose below 5 mg daily.

Adjustment for other toxicities in multiple myeloma: For additional treatment-related grade 3/4 toxicities, hold treatment and restart at next dose level when toxicity has resolved to ≤ grade 2.

Dosing: Combination Regimens

Multiple myeloma:

Lenalidomide-Dexamethasone

Lenalidomide-Dexamethasone (Low Dose)

Calculations

- ANC: Absolute Neutrophil Count

Administration: OralAdminister with water. Swallow capsule whole; do not break, open, or chew.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C and 30°C (59°F and 86°F).

RestrictionsLenalidomide is approved for marketing in the U.S. only under a Food and Drug Administration (FDA) approved, restricted distribution program called RevAssist^{SM} (www.REVLIMID.com or 1-888-423-5436). In Canada, distribution is restricted through RevAid^{SM} (www.RevAid.ca or 1-888-738-2431). Physicians, pharmacies, and patients must be registered; a maximum 28-day supply may be dispensed; a new prescription is required each time it is filled; pregnancy testing is required for females of childbearing potential.

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to lenalidomide or any component of the formulation; pregnancy or women capable of becoming pregnant; patients unable to comply with the RevAssist^{SM} program

Canadian labeling: Additional contraindications (not in U.S. labeling): Platelet count <50,000/mm^3; hypersensitivity to thalidomide; breast-feeding women

Warnings/Precautions

Boxed warnings:

- Hematologic toxicity: See “Concerns related to adverse effects” below.
- Pregnancy: See “Special populations” below.
- Thrombosis/embolism: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- CNS effects: May cause dizziness or fatigue; caution patients about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hematologic toxicity: **[U.S. Boxed Warning]: Hematologic toxicity (neutropenia and thrombocytopenia) occurs in a majority of patients (grade 3/4: 80%)** and may require dose reductions and/or delays; the use of blood product support and/or growth factors may be needed.
- Thromboembolic events: **[U.S. Boxed Warning]: Lenalidomide has been associated with a significant increase in risk for thrombosis and embolism in multiple myeloma patients treated with combination therapy. Deep vein thrombosis (DVT) and pulmonary embolism (PE) have occurred;** monitor for signs and symptoms of thromboembolism (shortness of breath, chest pain, or arm or leg swelling) and seek prompt medical attention with development of these symptoms.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; may experience an increased rate of toxicities.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Lenalidomide is an analogue of thalidomide (a human teratogen) and could potentially cause birth defects in humans.** Distribution is restricted; physicians, pharmacists, and patients must be registered with the RevAssist^{SM} program.

Other warnings/precautions:

- Blood donation: Patients should be advised not to donate blood during therapy and for 4 weeks following completion of therapy.
- Lactose intolerance: Product may contain lactose; avoid use in patients with Lapp lactase deficiency, glucose-galactose malabsorption, or glucose intolerance.

Geriatric Considerations The manufacturer reports that the frequency of serious adverse effects was higher in patients >65 years of age compared to younger patients (54% vs 33%). More older patients withdrew from the clinical studies because of side effects. There was no significant difference in efficacy in older versus younger patients.

Pregnancy Risk FactorX

Pregnancy Considerations**[U.S. Boxed Warning]: Lenalidomide is an analogue of thalidomide (a human teratogen) and could potentially cause birth defects in humans.** Animal studies with lenalidomide are ongoing; there are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be treated only if they are able to comply with the conditions of the RevAssist^{SM} program. Two forms of effective contraception are required beginning 4 weeks prior to, during, and for 4 weeks after therapy and during therapy interruptions. Pregnancy tests (sensitivity of at least 50 mIU/mL) should be performed 10-14 days and 24 hours prior to beginning therapy; weekly for the first 4 weeks and every 4 weeks (every 2 weeks if menstrual cycle irregular) thereafter and during therapy interruptions. Lenalidomide must be immediately discontinued and the patient referred to a reproductive toxicity specialist if pregnancy occurs during treatment. Males (even those vasectomized) should use a latex condom during any sexual contact with women of childbearing age. Risk to the fetus from semen of male patients is unknown. The parent or legal guardian for patients between 12 and 18 years of age must agree to ensure compliance with the required guidelines. Any suspected fetal exposure should be reported to the FDA via the MedWatch program (1-800-FDA-1088) and to Celgene Corporation (1-888-423-5436)

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for adverse reactions in nursing infants, breast-feeding is not recommended.

Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (8% to 21%)

Central nervous system: Fatigue (31% to 38%), insomnia (10% to 32%), pyrexia (21% to 23%), dizziness (20% to 21%), headache (20%)

Dermatologic: Pruritus (42%), rash (16% to 36%), dry skin (14%)

Endocrine & metabolic: Hyperglycemia (15%), hypokalemia (11%)

Gastrointestinal: Diarrhea (29% to 49%), constipation (24% to 39%), nausea (22% to 24%), weight loss (18%), dyspepsia (14%), anorexia (10% to 14%), taste perversion (6% to 13%), abdominal pain (8% to 12%)

Genitourinary: Urinary tract infection (11%)

Hematologic: Thrombocytopenia (17% to 62%; grades 3/4: 10% to 50%), neutropenia (28% to 59%; grades 3/4: 21% to 53%), anemia (12% to 24%; grades 3/4: 6% to 9%); myelosuppression is dose-dependent and reversible with treatment interruption and/or dose reduction

Neuromuscular & skeletal: Muscle cramp (18% to 30%), weakness (15% to 23%), arthralgia (10% to 22%), back pain (15% to 21%), tremor (20%), paresthesia (12%), limb pain (11%)

Ocular: Blurred vision (15%)

Respiratory: Nasopharyngitis (23%), cough (15% to 20%), dyspnea (7% to 20%), pharyngitis (16%), epistaxis (15%), upper respiratory infection (14% to 15%), pneumonia (11% to 12%)

1% to 10%:

Cardiovascular: Edema (10%), deep vein thrombosis (≤8%; grades 3/4: 7%), hypertension (6%), chest pain (5%), palpitation (5%), atrial fibrillation (grades 3/4: 3%), syncope (grade 3: 2%)

Central nervous system: Hypoesthesia (7%), pain (7%), depression (5%)

Dermatologic: Bruising (5% to 8%), cellulitis (5%), erythema (5%)

Endocrine & metabolic: Hypothyroidism (7%), hypomagnesemia (6%), hypocalcemia (grades 3/4: 4%)

Gastrointestinal: Vomiting (10%), xerostomia (7%), loose stools (6%)

Genitourinary: Dysuria (7%)

Hematologic: Leukopenia (8%; grade 3: 4%), febrile neutropenia (5%), lymphopenia (grade 3: 2%)

Hepatic: ALT increased (8%)

Neuromuscular & skeletal: Myalgia (9%), rigors (6%), neuropathy (peripheral 5%)

Respiratory: Sinusitis (8%), rhinitis (7%), bronchitis (6%), pulmonary embolism (≤3%; grades 3/4: 3%)

Miscellaneous: Night sweats (8%), diaphoresis increased (7%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acute febrile neutrophilic dermatosis, acute leukemia, acute myeloid leukemia (AML), adrenal insufficiency, angina, angioedema, aortic disorder, aphasia, azotemia, bacteremia, Basedow's disease, biliary obstruction, blindness, bone marrow depression, bradycardia, brain edema, C-reactive protein decreased, cardiac arrest, cardiac failure, cardiogenic shock, cardiomyopathy, cardiopulmonary arrest, cellulitis, cerebellar infarction, cerebral infarction, cerebrovascular accident, CHF, cholecystitis, chondrocalcinosis, chronic obstructive airway disease, circulatory collapse, coagulopathy, colonic polyp, dehydration, delirium, delusion, diabetes mellitus, diabetic ketoacidosis, diverticulitis, dysphagia, encephalitis, erythema multiforme, gait abnormal, gastritis, gastroenteritis, gastrointestinal hemorrhage, gout, hematuria, hemoglobin decreased, hemolysis, hemolytic anemia, hemorrhage, hepatitis, herpesvirus infection, hyperbilirubinemia, hypernatremia, hypersensitivity, hypoglycemia, hypotension, hypoxia, infection, INR increased, interstitial lung disease, intestinal perforation, intracranial hemorrhage, intracranial venous sinus thrombosis, irritable bowel syndrome, ischemia, ischemic colitis, leukoencephalopathy, liver failure, liver function tests abnormal, lung cancer, lung infiltration, lymphoma, melena, MI, migraine, myocardial ischemia, myopathy, neutropenic sepsis, orthostatic hypotension, pancreatitis, pancytopenia, performance status decreased, peripheral ischemia, phlebitis, post procedural hemorrhage, pseudomembraneous colitis, pulmonary edema, rectal hemorrhage, refractory anemia, renal calculus, renal failure, renal mass, renal tubular necrosis, respiratory failure, septic shock, sepsis, serum creatinine increased, skin desquamation, small bowel obstruction, somnolence, spinal cord compression, splenic infarction, Stevens-Johnson syndrome, stomatitis, subarachnoid hemorrhage, supraventricular arrhythmia, tachyarrhythmia, thrombophlebitis, thrombosis, toxic epidermal necrolysis, transient ischemic attack, troponin I increased, urinary retention, urosepsis, urticaria, ventricular dysfunction, wheezing

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Abatacept: Anti-TNF Agents may enhance the adverse/toxic effect of Abatacept. An increased risk of serious infection during concomitant use has been reported. *Risk D: Consider therapy modification*

Anakinra: Anti-TNF Agents may enhance the adverse/toxic effect of Anakinra. An increased risk of serious infection during concomitant use has been reported. *Risk X: Avoid combination*

Dexamethasone: May enhance the thrombogenic effect of Lenalidomide. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be

increased. *Risk X: Avoid combination*

Rilonacept: Anti-TNF Agents may enhance the adverse/toxic effect of Rilonacept. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid echinacea (has immunostimulant properties; consider therapy modifications).

Monitoring ParametersCBC with differential (MDS: weekly for first 8 weeks; MM: every 2 weeks for the first 3 months), then monthly thereafter; serum creatinine, liver function tests, thyroid function tests; ECG when clinically indicated; monitor for signs and symptoms of thromboembolism

Women of childbearing potential: Pregnancy test 10-14 days **and** 24 hours prior to initiating therapy, then every 2-4 weeks through 4 weeks after therapy discontinued

Nursing: Physical Assessment/MonitoringVerify that patient is not pregnant prior to initiating therapy. Instruct patient on the need to use two reliable forms of contraception beginning 4 weeks prior to, during, and for 4 weeks after therapy and during therapy interruptions. Monitor for signs of thromboembolism (shortness of breath, chest pain, or arm or leg swelling), infection, or bleeding. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsCBC with differential (MDS: weekly for first 8 weeks; MM: every 2 weeks for the first 3 months), then monthly thereafter; serum creatinine, liver function tests, thyroid function tests. Women of childbearing potential: Pregnancy test 10-14 days **and** 24 hours prior to initiating therapy, then every 2-4 weeks through 4 weeks after therapy discontinued

Patient EducationDo not take any new medication during therapy without consulting prescriber. You will need frequent blood tests while taking this medication. Maintain adequate hydration (2-3 L/day) unless instructed to restrict intake by prescriber. If you have diabetes, monitor blood glucose closely. Can cause hyperglycemia. You may be susceptible to infections. Avoid crowds and exposure to infections. Avoid vaccinations unless approved by prescriber. You may experience headache, fever, fatigue, dizziness (use caution when driving or engaging in activities requiring alertness until response to drug is known), swelling of extremities, rash, itching, nausea, diarrhea (buttermilk, boiled milk, or yogurt may help), constipation (increasing exercise, fluids, fruit/fiber may help), abdominal pain, upper respiratory infections, or sore throat. Report shortness of breath; chest pain; arm or leg swelling; extreme weakness or fatigue; muscle cramping; unusual bleeding or bruising; or nosebleeds. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. May cause fetal harm. Two forms of contraception are required beginning 4 weeks prior to, during, and for 4 weeks after therapy and during therapy interruptions. Male patients must use a latex condom even if he has undergone a successful vasectomy when having sexual contact with females of childbearing age. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Revlimid®: 5 mg, 10 mg, 15 mg, 25 mg

Generic AvailableNo

ManufacturerCelgene Corp

Mechanism of ActionImmunomodulatory, antiangiogenic, and antineoplastic characteristics via multiple mechanisms. Selectively inhibits secretion of proinflammatory cytokines (potent inhibitor of tumor necrosis factor-alpha secretion); enhances cell-mediated immunity by stimulating proliferation of anti-CD3 stimulated T cells (resulting in increased IL-2 and interferon gamma secretion); inhibits trophic signals to angiogenic factors in cells. Inhibits the growth of myeloma cells by inducing cell cycle arrest and cell death.

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: ~30%

Half-life elimination: ~3 hours

Time, to peak, plasma: Healthy volunteers: 0.6-1.5 hours; Myeloma patients: 0.5-4 hours

Excretion: Urine (~67% as unchanged drug)

Pharmacotherapy PearlsPregnancy tests are required prior to beginning therapy, throughout treatment and during therapy interruptions for all women of childbearing age. The pregnancy test must be verified by the prescriber and the pharmacist prior to dispensing. Effective contraception with at least two reliable forms of contraception (IUD, hormonal contraception, tubal ligation or partner's vasectomy plus latex condom, diaphragm, or cervical cap) should be used for 4 weeks prior to beginning therapy, during therapy, and for 4 weeks following discontinuance of therapy. Women who have undergone a hysterectomy or have been postmenopausal for at least 24 consecutive months are the only exception. Do not prescribe, administer, or dispense to women of childbearing age or males who may have intercourse with women of childbearing age unless both female and male are capable of complying with contraceptive measures. Even males who have undergone vasectomy must acknowledge these risks in writing, and must use a latex condom during any sexual contact with women of childbearing age. Oral and written warnings concerning contraception and the hazards of thalidomide must be conveyed to females and males and they must acknowledge their understanding in writing. Parents or guardians must consent and sign acknowledgment for patients 12-18 years of age following therapy. A maximum 28-day supply should be dispensed.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and fatigue are common; may cause insomnia or depression (check thyroid function tests)

Mental Health: Effects on Psychiatric TreatmentHematologic side effects are common; concomitant use with clozapine and carbamazepine are best avoided. GI side effects are common; concomitant use with SSRIs, lithium, valproic acid, and carbamazepine may produce additive effects. May cause hypothyroidism; concomitant use with lithium may produce additive effects.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(leh puh ROO din)
U.S. Brand NamesRefludan®
Canadian Brand NamesRefludan®
Pharmacologic CategoryAnticoagulant, Thrombin Inhibitor
Use: Labeled IndicationsIndicated for anticoagulation in patients with heparin-induced thrombocytopenia (HIT) and associated thromboembolic disease in order to prevent further thromboembolic complications
Use: Unlabeled/InvestigationalInvestigational: Prevention or reduction of ischemic complications associated with unstable angina
Dosing: Adults**Note:** Maximum infusion dose: Do not exceed 0.21 mg/kg/hour unless an evaluation of coagulation abnormalities limiting response has been completed.

Heparin-induced thrombocytopenia: Bolus dose: 0.4 mg/kg IVP (over 15-20 seconds), followed by continuous infusion at 0.15 mg/kg/hour (maximum initial bolus dose: 44 mg; maximum initial infusion dose: 16.5 mg/hour); bolus and infusion must be reduced in renal insufficiency

or

Alternate dosing regimen (unlabeled dose; Selleng, 2007; Warkentin, 2008): Bolus dose: 0.2 mg/kg (use only if life- or limb-threatening thrombosis present) followed by continuous infusion of 0.05-0.1 mg/kg/hour. Further dosage reduction may be required in patients with renal dysfunction. This alternate dosing regimen has been recommended due to higher rates of bleeding associated with the FDA-approved dosing regimen.

Concomitant use with thrombolytic therapy: I.V.: Bolus dose: 0.2 mg/kg IVP (over 15-20 seconds), followed by continuous infusion at 0.1 mg/kg/hour

Dosing adjustments during infusions: Monitor first aPTT 4 hours after the start of the infusion. Subsequent determinations of aPTT should be obtained at least once daily during treatment. More frequent monitoring is recommended in renally- or hepatically-impaired patients. Any aPTT ratio measurement out of range (1.5-2.5) should be confirmed prior to adjusting dose, unless a clinical need for immediate reaction exists. If the aPTT is below target range, increase infusion by 20%. If the aPTT is in excess of the target range, stop infusion for 2 hours and when restarted the infusion rate should be decreased by 50%. A repeat aPTT should be obtained 4 hours after any dosing change.

Transition to oral anticoagulants: Once platelets normalize, reduce lepirudin dose gradually to reach aPTT ratio just above 1.5 before starting warfarin therapy. Monitor PT/INR closely until results stabilize in therapeutic range. When lepirudin is discontinued, there may be a small reduction in INR.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentAll patients with a creatinine clearance of <60 mL/minute or a serum creatinine of >1.5 mg/dL require dosage reduction; there is only limited information on the therapeutic use of lepirudin in patients with HIT and significant renal impairment; the following dosage recommendations are mainly based on single-dose studies in a small number of patients with renal impairment. An alternate dosing regimen has also been recommended for patients with serum creatinine >1 mg/dL (Warkentin, 2008).

Initial: Bolus dose: 0.2 mg/kg IVP (over 15-20 seconds), followed by adjusted infusion based on renal function; refer to the following infusion rate adjustments based on creatinine clearance (mL/minute) and serum creatinine (mg/dL):

Note: Acute renal failure or hemodialysis: Infusion is to be avoided or stopped. Following the bolus dose, additional bolus doses of 0.1 mg/kg may be administered every other day only if aPTT falls below lower therapeutic limit (1.5-times patient baseline [or mean laboratory] aPTT).

Lepirudin infusion rates in patients with renal impairment: See tables.

Lepirudin Infusion Rates in Patients With Renal Impairment

Creatinine Clearance (mL/min)	Serum Creatinine (mg/dL)	Adjusted Infusion Rate	
		% of Standard Initial Infusion Rate	mg/kg/h
45-60	1.6-2.0	50%	0.075

30-44	2.1-3.0	30%	0.045
15-29	3.1-6.0	15%	0.0225
<15	>6.0	***Avoid or STOP infusion***	

Alternate Dosing Regimen for Renal Impairment (based on *Chest* 2008 guidelines[1])

Serum Creatinine (mg/dL)	**Adjusted Infusion Rate**	
	% of Standard Initial Infusion Rate[2]	**mg/kg/h**
1.0-1.6	50%	0.05
1.7-4.5	10%	0.01
>4.5-6.0	5%	0.005
>6.0	***Avoid or STOP infusion[3]***	
[1] Recommendation based on low or very low-quality evidence.		
[2] Recommended standard initial infusion rate: 0.1 mg/kg/hour		
[3] Recommendation based on manufacturer's labeling.		
Note: The initial bolus should either be omitted, or in the case of perceived life- or limb-threatening thrombosis, be given at a reduced dose of 0.2 mg/kg.		

Calculations

- Creatinine Clearance: Adults

Administration: I.V.I.V. bolus: Inject slowly for continuous infusion; solutions with 0.2 or 0.4 mg/mL may be used.

Administration: OralAdminister **only** intravenously

Storage

Intact vials should be stored at 2°C to 25°C (36°F to 77°F). Manufacturer recommends using reconstituted solution immediately after preparation. Reconstituted solutions of lepirudin are stable for 24 hours at room temperature.

Reconstitution

Intravenous bolus: Use a solution with a concentration of 5 mg/mL: Reconstitute one vial (50 mg) of lepirudin with 1 mL of sterile water for injection or 0.9% sodium chloride injection. The final concentration of 5 mg/mL is obtained by transferring the contents of the vial into a sterile, single-use syringe (of at least 10 mL capacity) and diluting the solution to a total volume of 10 mL using sterile water for injection, 0.9% sodium chloride, or 5% dextrose in water.

Intravenous infusion: For continuous intravenous infusion, solutions with concentrations of 0.2 or 0.4 mg/mL may be used. Reconstitute 2 vials (50 mg each) of lepirudin with 1 mL each using either sterile water for injection or 0.9% sodium chloride injection. The final concentration of 0.2 mg/mL or 0.4 mg/mL is obtained by transferring the contents of both vials into an infusion bag containing 500 mL or 250 mL of 0.9% sodium chloride injection or 5% dextrose injection.

CompatibilityStable in D_5W, NS.

Y-site administration: Visually compatible (Chalmers, 2001): Amiodarone.

ContraindicationsHypersensitivity to hirudins or any component of the formulation

Allergy Considerations

- Hirudin Derivatives Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Allergic and hypersensitivity reactions, including anaphylaxis have been reported. Be cautious in re-exposing patients (anaphylaxis has been reported).

- Bleeding: The most common complication is bleeding. Certain patients are at increased risk of bleeding; risk factors include bacterial endocarditis; congenital or acquired bleeding disorders; recent puncture of large vessels or organ biopsy; recent CVA, stroke, intracerebral surgery, or other neuraxial procedure; severe uncontrolled hypertension; renal impairment; recent major surgery; recent major bleeding (intracranial, GI, intraocular, or pulmonary). Monitor for signs and symptoms of bleeding.

Disease-related concerns:

- Cirrhosis: Use with caution in patients with cirrhosis.

- Renal impairment: Use with caution in patients with renal impairment, relative overdose might occur even with standard dosage regimen. The bolus dose and rate of infusion must be reduced in patients with known or suspected renal insufficiency.

- Thrombolytic episode: Cautiously administer after a thrombolytic episode; risk of intracranial bleeding.

Concurrent drug therapy issues:

- Streptokinase: Allergic reactions may occur frequently in patients treated concomitantly with streptokinase.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Monitoring: Strict monitoring of aPTT is required; formation of antihirudin antibodies can increase the anticoagulant effect of lepirudin.

Pregnancy Risk FactorB

Pregnancy ConsiderationsLepirudin crosses the placenta in pregnant rats; however, it is not known if lepirudin crosses the placenta in humans.

LactationEnters breast milk/consult prescriber

Adverse ReactionsAs with all anticoagulants, bleeding is the most common adverse event associated with lepirudin. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables.

HIT patients:

>10%: Hematologic: Anemia (12%), bleeding from puncture sites (11%), hematoma (11%)

1% to 10%:

Cardiovascular: Heart failure (3%), pericardial effusion (1%), ventricular fibrillation (1%)

Central nervous system: Fever (7%)

Dermatologic: Maculopapular rash (4%), eczema (3%)

Gastrointestinal: GI bleeding/rectal bleeding (5%)

Genitourinary: Vaginal bleeding (2%)

Hepatic: Transaminases increased (6%)

Renal: Hematuria (4%)

Respiratory: Epistaxis (4%)

<1% (Limited to important or life-threatening): Allergic reactions, anaphylaxis, hemoperitoneum, hemoptysis, intracranial bleeding, liver bleeding, pulmonary bleeding, retroperitoneal bleeding, mouth bleeding, pruritus, urticaria, injection site reactions, thrombocytopenia

Non-HIT populations (including those receiving thrombolytics and/or contrast media):

1% to 10%: Respiratory: Bronchospasm/stridor/dyspnea/cough

<1% (Limited to important or life-threatening): Angioedema, laryngeal edema, tongue edema, intracranial bleeding (0.6%), allergic reactions (unspecified), anaphylactoid reactions, anaphylaxis, thrombocytopenia

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng (all have additional antiplatelet activity)

Test InteractionsPT/INR levels may become elevated in the absence of warfarin. If warfarin is initiated, initial PT/INR goals while on lepirudin may require modification.

Monitoring ParametersMonitor aPTT levels; obtain baseline aPTT, then monitor first aPTT 4 hours after the start of the infusion and every 4 hours until steady state is reached (2 consecutive aPTTs in the same range) (Warkentin, 2008). Subsequent determinations of aPTT should be obtained at least once daily during treatment. More frequent monitoring is recommended in renally- or hepatically-impaired patients. Any aPTT ratio measurement out of range (1.5-2.5) should be confirmed prior to adjusting dose, unless a clinical need for immediate reaction exists

Reference RangeaPTT 1.5 to 2.5 times the control value

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (especially anything that will affect coagulation or platelet function). Note Administration for infusion specifics. Bleeding precautions should be observed. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, hypersensitivity reaction, bleeding, chest pain, rash) regularly during therapy. Teach possible side effects/appropriate interventions (eg, bleeding precautions) and adverse symptoms to report.

Monitoring: Lab TestsMonitor aPTT levels; obtain baseline aPTT, then monitor first aPTT 4 hours after the start of the infusion and every 4 hours until steady state is reached (2 consecutive aPTTs in the same range) (Warkentin, 2008). Subsequent determinations of aPTT should be obtained at least once daily during treatment. More frequent monitoring is recommended in renally- or hepatically-impaired patients. Any aPTT ratio measurement out of range (1.5-2.5) should be confirmed prior to adjusting dose, unless a clinical need for immediate reaction exists

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be administered by infusion. Report immediately any pain, swelling, burning, or bleeding at infusion site. You may have a tendency to bleed easily while taking this drug (brush teeth with soft brush, floss with waxed floss, use electric razor, avoid scissors or sharp knives, and avoid potentially harmful activities). Report unusual bleeding or bruising (bleeding gums, nosebleed, blood in urine, dark stool); pain in joints or back; CNS changes (fever, confusion); unusual fever; persistent nausea or GI upset; or swelling or pain at injection site. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 50 mg

Generic AvailableNo

Mechanism of ActionLepirudin is a highly specific direct inhibitor of thrombin; lepirudin is a recombinant hirudin derived from yeast cells

Pharmacodynamics/Kinetics

Distribution: Two-compartment model; confined to extracellular fluids.

Metabolism: Via release of amino acids via catabolic hydrolysis of parent drug

Half-life elimination: Initial: ~10 minutes: Terminal: Healthy volunteers: 1.3 hours; Marked renal impairment (Cl_{cr} <15 mL/minute and on hemodialysis): ≤2 days

Excretion: Urine (~48%, 35% as unchanged drug and unchanged drug fragments of parent drug); systemic clearance is proportional to glomerular filtration rate or creatinine clearance

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentContraindicated in patients with a recent stroke

Cardiovascular Considerations

Heparin-Induced Thrombocytopenia (HIT): In a case series of 9 patients with HIT, the combination of intravenous lepirudin and a GPIIb/IIIa inhibitor was safe and effective during PCI (Pinto DS, 2003). Another case report describes use in patients with HIT during cardiopulmonary bypass (Liu H, 2002). During prolonged treatment (>5 days) in HIT patients, anticoagulant activity should be monitored daily (Eichler P, 2000). Antihirudin antibodies develop frequently and may enhance lepirudin's activity. In this trial, about half of the patients who developed antihirudin antibodies required a 45% (range: 17% to 90%) decrease in dose.

Subcutaneous Administration of Lepirudin: Initial data for the subcutaneous administration of lepirudin shows promise. A multicenter, prospective, dose-ranging trial of lepirudin for the treatment of deep venous thrombosis demonstrated that a dose of lepirudin 1.25 mg/kg every 12 hours was safe and effective at reducing the incidence of subsequent thromboembolic events when compared to heparin; however, this trial was small with only 155 patients enrolled (Schiele F, 1997). Another small trial of 19 patients with either heparin-induced thrombocytopenia (HIT) and thromboembolism, isolated HIT, or history of HIT and needing interruption of oral anticoagulation, evaluated the subcutaneous administration of lepirudin at a dose of 25 mg twice daily (Hule G, 2000). Patients with HIT and thromboembolic complications were administered continuous intravenous lepirudin to maintain a therapeutic aPTT for the first 10 days of therapy then switch to subcutaneous lepirudin. The authors found that administration of subcutaneous lepirudin was safe and effective. One important observation was 63% of patients developed antibodies to lepirudin prolonging the peak and trough aPTTs when compared to the group without antibodies to lepirudin. The duration of administration ranged from 20-26 days. Based on these trials, there is emerging evidence that subcutaneous administration of lepirudin may be safe and effective; however, large trials are needed to fully describe how to utilize this therapy.

Anaphylaxis: Fatal anaphylactic reactions have been reported in patients re-exposed to lepirudin in a second or subsequent treatment course. Consider alternative treatment options. Since these reactions are immune-mediated, patient with recent exposure to hirudins may be at increased risk.

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Heparin-Induced Thrombocytopenia (HIT): In a case series of 9 patients with HIT, the combination of lepirudin and a GP IIb/IIIa inhibitor was safe and effective during PCI (Pinto, 2003). Another case report describes use in patients with HIT during cardiopulmonary bypass (Liu, 2002). During prolonged treatment (>5 days) in HIT patients, anticoagulant activity should be monitored daily (Eichler, 2000). Antihirudin antibodies develop frequently and may enhance lepirudin's activity. In this trial, about half of the patients who developed antihirudin antibodies required a 45% (range: 17% to 90%) decrease in dose.

The American College of Chest Physicians Evidence Based Clinical Practice Guidelines (8th Edition, 2008) recommend reducing the initial lepirudin dose based on serum creatinine concentrations (Cr) for the treatment of heparin-induced thrombocytopenia (see Dosing: Renal Impairment).

Medication Safety Issues

Sound-alike/look-alike issues:

Femara® may be confused with Famvir®, femhrt®, Provera®

Letrozole may be confused with anastrozole

Pronunciation(LET roe zole)
U.S. Brand NamesFemara®
Canadian Brand NamesFemara®
Pharmacologic CategoryAntineoplastic Agent, Aromatase Inhibitor
Use: Labeled IndicationsFor use in postmenopausal women in the adjuvant treatment of hormone receptor positive early breast cancer, extended adjuvant treatment of early breast cancer after 5 years of tamoxifen, advanced breast cancer with disease progression following antiestrogen therapy, hormone receptor positive or hormone receptor unknown, locally-advanced, or metastatic breast cancer
Use: Unlabeled/InvestigationalTreatment of ovarian (epithelial) cancer, endometrial cancer
Dosing: Adults

Breast cancer: Females: Oral: 2.5 mg once daily

Ovarian (epithelial) cancer (unlabeled use): Oral: 2.5 mg once daily (Ramirez, 2008)

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo dosage adjustment is required in patients with renal impairment if Cl_{cr} is ≥10 mL/minute.
Dosing: Hepatic Impairment

Mild-to-moderate impairment (Child-Pugh class A and B): No adjustment recommended

Severe impairment (Child-Pugh class C): 2.5 mg every other day

Administration: OralAdminister with or without food.
Dietary ConsiderationsMay be taken without regard to meals. Calcium and vitamin D supplementation are recommended.
StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to letrozole or any component of the formulation; women of premenopausal endocrine status
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- CNS depression: May cause dizziness, fatigue, and somnolence; patients should be cautioned before performing tasks which require mental alertness (eg, operating machinery or driving).

- Decreased bone mineral density: May cause decreases in bone mineral density.

- Increased cholesterol: May increase total serum cholesterol.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; dose adjustment may be required. Increases in transaminases ≥5 times the upper limit of normal and in bilirubin ≥1.5 times the upper limit of normal were most often, but not always, associated with metastatic liver disease.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo dosage adjustment recommended.
Pregnancy Risk FactorD
Pregnancy ConsiderationsLetrozole may cause fetal harm when administered to pregnant women. Animal studies have demonstrated embryotoxicity and fetotoxicity. There are no adequate and well-controlled studies in pregnant women. If used in pregnancy, or if patient becomes pregnant during treatment, the patient should be apprised of potential hazard to the fetus. Letrozole is FDA indicated for postmenopausal women only. Women who are perimenopausal or recently postmenopausal should use adequate contraception until postmenopausal status is fully established.
LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Edema (7% to 18%)

Central nervous system: Headache (4% to 20%), dizziness (2% to 14%), fatigue (6% to 13%)

Endocrine & metabolic: Hot flashes (5% to 50%), hypercholesterolemia (3% to 16%)

Gastrointestinal: Nausea (9% to 17%), constipation (2% to 11%), weight gain (2% to 11%)

Neuromuscular & skeletal: Weakness (4% to 34%), bone pain (22%), arthralgia (8% to 22%), arthritis (7% to 21%), back pain (5% to 18%)

Respiratory: Dyspnea (6% to 18%), cough (5% to 13%)

Miscellaneous: Diaphoresis (≤24%), night sweats (14%)

2% to 10%:

Cardiovascular: Chest pain (3% to 8%), hypertension (5% to 8%), peripheral edema (5%)

Central nervous system: Insomnia (6% to 7%), pain (5%), somnolence (2% to 3%), depression (<5%), anxiety (<5%), vertigo (<5%)

Dermatologic: Rash (4% to 5%), alopecia (<5%), pruritus (1% to 2%)

Endocrine & metabolic: Breast pain (7%), hypercalcemia (<5%)

Gastrointestinal: Diarrhea (5% to 8%), vomiting (3% to 7%), weight loss (7%), abdominal pain (5% to 6%), anorexia (3% to 5%), dyspepsia (3% to 4%)

Genitourinary: Urinary tract infection (6%), vaginal bleeding (5%), vaginal dryness (5%), vaginal hemorrhage (5%), vaginal irritation (4%)

Hepatic: Transaminases increased (≤3%)

Neuromuscular & skeletal: Limb pain (10%), myalgia (6% to 7%), bone fractures (≤6%), bone mineral density decreased/osteoporosis (2% to 7%)

Renal: Renal disorder (5%)

Respiratory: Pleural effusion (<5%)

Miscellaneous: Infection (7%), flu (6%), viral infection (5% to 6%)

<2%, postmarketing, and/or case reports: Anaphylactic reaction, angina, angioedema, appetite increase, arterial thrombosis, bilirubin increased, blurred vision, cardiac ischemia, cardiac failure, cataract, coronary artery disease, dry skin, dysesthesia, endometrial cancer, endometrial proliferation disorder, eye irritation, fever, hemiparesis, hemorrhagic stroke, hypoesthesia, irritability, leukopenia, lymphopenia, MI, memory impairment, nervousness, palpitations, paresthesia, portal vein thrombosis, pulmonary embolism, secondary malignancy, stomatitis, tachycardia, taste disturbance, thirst, thrombocytopenia, thrombophlebitis, thromboembolic event, thrombotic stroke, transient ischemic attack, urinary frequency increased, urticaria, vaginal discharge, venous thrombosis, xerostomia

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** (minor) of CYP2A6, 3A4; **Inhibits** CYP2A6 (strong), 2C19 (weak)

Drug Interactions

CYP2A6 Substrates: CYP2A6 Inhibitors (Strong) may decrease the metabolism of CYP2A6 Substrates. *Risk D: Consider therapy modification*

Tamoxifen: May decrease the serum concentration of Letrozole. *Risk C: Monitor therapy*

Monitoring ParametersMonitor periodically during therapy: Complete blood counts, thyroid function tests; serum electrolytes, cholesterol, transaminases, and creatinine; blood pressure; bone density

Nursing: Physical Assessment/MonitoringFor use in postmenopausal women only. Assess potential for interactions or toxicity with other pharmacological agents or herbal products patient may be taking. Evaluate results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, hypertension, pain, gastrointestinal upset, hot flashes) on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, cholesterol, thyroid function tests, serum electrolytes, serum transaminases, serum creatinine

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take exactly as directed. You may experience nausea, vomiting, hot flashes, or loss of appetite (frequent mouth care, small, frequent meals, chewing gum, or sucking lozenges may help); musculoskeletal pain or headache (consult prescriber for analgesics relief); sleepiness, fatigue, or dizziness (use caution when driving, climbing stairs, or engaging in tasks that require alertness until response to drug is known); constipation (increased exercise or dietary fruit or fluids may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or loss of hair (will grow back). Report chest pain, pressure, palpitations, or swollen extremities; weakness, severe headache, numbness, or loss of strength in any part of the body; difficulty speaking; vaginal bleeding; unusual signs of bleeding or bruising; respiratory difficulty; severe nausea; or muscle pain; or skin rash.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Femara®: 2.5 mg

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp
Pricing: U.S. (www.drugstore.com)

Tablets (Femara)

2.5 mg (10): $126.93

Mechanism of ActionNonsteroidal competitive inhibitor of the aromatase enzyme system which binds to the heme group of aromatase, a cytochrome P450 enzyme which catalyzes conversion of androgens to estrogens (specifically, androstenedione to estrone and testosterone to estradiol). This leads to inhibition of the enzyme and a significant reduction in plasma estrogen (estrone, estradiol and estrone sulfate) levels. Does not affect synthesis of adrenal or thyroid hormones, aldosterone, or androgens.
Pharmacodynamics/Kinetics

Absorption: Rapid and well absorbed; not affected by food

Distribution: V_d: ~1.9 L/kg

Protein binding, plasma: Weak

Metabolism: Hepatic via CYP3A4 and 2A6 to an inactive carbinol metabolite

Half-life elimination: Terminal: ~2 days

Time to steady state, plasma: 2-6 weeks

Excretion: Urine (90%; 6% as unchanged drug, 75% as glucuronide carbinol metabolite, 9% as unidentified metabolites)

Medication Safety Issues

Sound-alike/look-alike issues:

Leucovorin may be confused with Leukeran®, Leukine®, LEVOleucovorin

Folinic acid may be confused with folic acid

Folinic acid is an error prone synonym and should not be used

Pronunciation(loo koe VOR in KAL see um)

Pharmacologic CategoryAntidote; Chemotherapy Modulating Agent; Rescue Agent (Chemotherapy); Vitamin, Water Soluble

Use: Labeled IndicationsAntidote for folic acid antagonists (methotrexate, trimethoprim, pyrimethamine) and rescue therapy following high-dose methotrexate; in combination with fluorouracil in the treatment of colon cancer; treatment of megaloblastic anemias when folate is deficient as in infancy, sprue, pregnancy, and nutritional deficiency when oral folate therapy is not possible

Use: Unlabeled/InvestigationalI.T. administration following I.T. methotrexate overdose; adjunctive cofactor therapy in methanol toxicity

Dosing: Adults

Treatment of folic acid antagonist overdosage: Oral: 5-15 mg/day

Folate-deficient megaloblastic anemia: I.M.: ≤1 mg/day

High-dose methotrexate-rescue dose: Initial: Oral, I.M., I.V.: 15 mg (~10 mg/m^2); start 24 hours after beginning methotrexate infusion; continue every 6 hours for 10 doses, until methotrexate level is <0.05 micromole/L. Adjust dose as follows:

Normal methotrexate elimination: Oral, I.M., I.V.: 15 mg every 6 hours

Delayed early methotrexate elimination: I.V.: 150 mg every 3 hours until methotrexate level is <1 micromole/L, then 15 mg every 3 hours until methotrexate level is <0.05 micromole/L

Colorectal cancer (also refer to Combination Regimens):

I.V.: 200 mg/m^2 over at least 3 minutes (used in combination with fluorouracil 370 mg/m^2)

or

I.V.: 20 mg/m^2 (used in combination with fluorouracil 425 mg/m^2)

Pemetrexed toxicity (unlabeled dose): I.V.: 100 mg/m^2 once, followed by 50 mg/m^2 every 6 hours for 8 days was used in clinical trial for CTC grade 4 leukopenia ≥3 days; CTC grade 4 neutropenia ≥3 days; immediately for CTC grade 4 thrombocytopenia, bleeding associated with grade 3 thrombocytopenia, or grade 3 or 4 mucositis

Cofactor therapy in methanol toxicity (unlabeled use): I.V.: 50 mg every 4-6 hours. Therapy should continue until methanol and formic acid have been completely eliminated.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of folic acid antagonist overdosage: Refer to adult dosing.

Folate-deficient megaloblastic anemia: Refer to adult dosing.

High-dose methotrexate-rescue dose: Refer to adult dosing.

Dosing: Combination Regimens

- CHAMOMA (Bagshawe Regimen)
- EMA/CO
- EP/EMA

Head and neck cancer:

- PFL (Head and Neck Cancer)
- PFL + IFN

Leukemia, acute lymphocytic:

- Hyper-CVAD + Imatinib
- Hyper-CVAD (Leukemia, Acute Lymphocytic)
- Linker Protocol
- PVA (POG 8602)

Lymphoma, non-Hodgkin's:

- CODOX-M/IVAC
- COMLA
- Hyper-CVAD (Lymphoma, non-Hodgkin's)
- MACOP-B
- m-BACOD
- Pro-MACE-CytaBOM

Lymphoma, non-Hodgkin's (Burkitt's): CODOX-M/IVAC

Lymphoma, non-Hodgkin's: (Mantle cell): Hyper-CVAD + Rituximab

Osteosarcoma:

- HDMTX
- MTX-CDDPAdr
- POG-8651

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Due to calcium content, do not administer I.V. solutions at a rate >160 mg/ minute.

Refer to individual protocols. Should be administered I.M., I.V. push, or I.V. infusion (15 minutes to 2 hours). Leucovorin should not be administered concurrently with methotrexate. It is commonly initiated 24 hours after the start of methotrexate. Toxicity to normal tissues may be irreversible if leucovorin is not initiated by ~40 hours after the start of methotrexate.

As a rescue after folate antagonists: Administer by I.V. bolus, I.M., or orally.

In combination with fluorouracil: Fluorouracil activity, the fluorouracil is usually given after, or at the midpoint, of the leucovorin infusion. Leucovorin is usually administered by I.V. bolus injection or short (10-120 minutes) I.V. infusion. Other administration schedules have been used; refer to individual protocols.

Administration: I.V. DetailpH: 8.1 (vials)

Administration: OralDo not administer orally in the presence of nausea or vomiting. Doses >25 mg should be administered parenterally.

Dietary ConsiderationsSolutions for injection contain calcium 0.004 mEq per leucovorin 1 mg

Storage

Powder for injection: Store at room temperature of 25°C (77°F). Protect from light. Solutions reconstituted with bacteriostatic water for injection U.S.P., must be used within 7 days. Solutions reconstituted with SWFI must be used immediately. Parenteral admixture is stable for 24 hours stored at room temperature (25°C) and for 4 days when stored under refrigeration (4°C).

Solution for injection: Prior to dilution, store vials under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light.

Tablet: Store at room temperature of 15°C to 30°C (59°F to 86°F).

ReconstitutionPowder for injection: Reconstitute with SWFI or BWFI; dilute in 100-1000 mL NS, D_5W for infusion. When doses >10 mg/m^2 are required, reconstitute using sterile water for injection, not a solution containing benzyl alcohol.

CompatibilityStable in D_{10}NS, D_5W, D_{10}W, LR, sterile water for injection, bacteriostatic water, bacteriostatic NS; **variable stability (consult detailed reference)** in NS.

Y-site administration: Compatible: Amifostine, aztreonam, bleomycin, cefepime, cisplatin, cladribine, cyclophosphamide, docetaxel, doxorubicin, doxorubicin liposome, etoposide phosphate, filgrastim, fluconazole, fluorouracil, furosemide, gatifloxacin, gemcitabine, granisetron, heparin, irinotecan, linezolid, methotrexate, metoclopramide, mitomycin, piperacillin/tazobactam, tacrolimus, teniposide, thiotepa, vinblastine, vincristine. **Incompatible:** Amphotericin B cholesteryl sulfate complex, droperidol, foscarnet, sodium bicarbonate.

Compatibility in syringe: Compatible: Bleomycin, cisplatin, cyclophosphamide, doxorubicin, fluorouracil, furosemide, heparin, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine. **Incompatible:** Droperidol.

Compatibility when admixed: Compatible: Cisplatin, cisplatin with floxuridine, floxuridine. **Incompatible:** Concentrations >2 mg/mL of leucovorin and >25 mg/mL of fluorouracil.

ContraindicationsPernicious anemia or vitamin B_{12}-deficient megaloblastic anemias

Warnings/Precautions

Concurrent drug therapy issues:

- Fluorouracil: Leucovorin may increase the toxicity of 5-fluorouracil; dose of 5-fluorouracil may need decreased.
- Sulfamethoxazole-trimethoprim: Combination of leucovorin and sulfamethoxazole-trimethoprim for the acute treatment of PCP in patients with HIV infection has been reported to cause increased rates of treatment failure.

Dosage form specific issues:

- Powder for injection: When doses >10 mg/m^2 are required, reconstitute using sterile water for injection, not a solution containing benzyl alcohol.
- Injection: Due to calcium content, do not administer I.V. solutions at a rate >160 mg/minute. Not intended for intrathecal use.

Other warnings and precautions:

- Folic acid antagonist overdose: When used for the treatment of accidental folic acid antagonist overdose, administer as soon as possible.
- Methotrexate rescue therapy: Methotrexate serum concentrations should be monitored to determine dose and duration of leucovorin therapy. Dose may need increased or administration prolonged in situations where methotrexate excretion may be delayed (eg, ascites, pleural effusion, renal insufficiency, inadequate hydration)

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Leucovorin is a biologically active form of folic acid. Adequate amounts of folic acid are recommended during pregnancy. Refer to Folic Acid monograph.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsLeucovorin is a biologically active form of folic acid. Adequate amounts of folic acid are recommended in breast-feeding women. Refer to Folic Acid monograph.

Adverse ReactionsFrequency not defined. Toxicities (especially gastrointestinal toxicity) of fluorouracil is higher when used in combination with leucovorin.

Dermatologic: Rash, pruritus, erythema, urticaria

Hematologic: Thrombocytosis

Respiratory: Wheezing

Miscellaneous: Allergic reactions, anaphylactoid reactions

Oncology: VesicantNo
Oncology: Emetic PotentialLow
Drug Interactions

Capecitabine: Leucovorin-Levoleucovorin may enhance the adverse/toxic effect of Capecitabine. *Risk C: Monitor therapy*

Fluorouracil: Leucovorin-Levoleucovorin may enhance the adverse/toxic effect of Fluorouracil. This effect is associated with the ability of leucovorin or levoleucovorin to enhance the anticancer effects of fluorouracil. *Risk C: Monitor therapy*

PHENobarbital: Leucovorin-Levoleucovorin may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Leucovorin-Levoleucovorin may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Primidone: Leucovorin-Levoleucovorin may decrease the serum concentration of Primidone. Additionally, leucovorin/levoleucovorin may decrease concentrations of active metabolites of primidone (e.g., phenobarbital). *Risk C: Monitor therapy*

Raltitrexed: Leucovorin-Levoleucovorin may diminish the therapeutic effect of Raltitrexed. *Risk X: Avoid combination*

Trimethoprim: Leucovorin-Levoleucovorin may diminish the therapeutic effect of Trimethoprim. *Risk D: Consider therapy modification*

Monitoring Parameters

High-dose methotrexate therapy: Plasma methotrexate concentration; leucovorin is continued until the plasma methotrexate level <0.05 micromole/L. With 4- to 6-hour high-dose methotrexate infusions, plasma drug values in excess of 50 and 1 micromole/L at 24 and 48 hours after starting the infusion, respectively, are often predictive of delayed methotrexate clearance.

Fluorouracil therapy: CBC with differential and platelets, liver function tests, electrolytes

Nursing: Physical Assessment/MonitoringAssess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report. Monitor laboratory tests, adverse reactions, and therapeutic response.
Monitoring: Lab Tests

High-dose methotrexate therapy: Plasma methotrexate concentration; leucovorin is continued until the plasma methotrexate level <0.05 micromole/L. With 4- to 6-hour high-dose methotrexate infusions, plasma drug values in excess of 50 and 1 micromole/L at 24 and 48 hours after starting the infusion, respectively, are often predictive of delayed methotrexate clearance.

Fluorouracil therapy: CBC with differential and platelets, liver function tests, electrolytes

Patient EducationTake as directed, at evenly spaced intervals around-the-clock. Maintain hydration (2-3 L of water/day while taking for rescue therapy). For folic acid deficiency, eat foods high in folic acid (eg, meat proteins, bran, dried beans, asparagus, green leafy vegetables). Report respiratory difficulty, lethargy, or rash or itching. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. **Note:** Strength expressed as base

Injection, powder for reconstitution: 50 mg, 100 mg, 200 mg, 350 mg

Injection, solution [preservative free]: 10 mg/mL (50 mL)

Tablet: 5 mg, 10 mg, 15 mg, 25 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Leucovorin Calcium)

10 mg (24): $152.99

Mechanism of ActionA reduced form of folic acid, leucovorin supplies the necessary cofactor blocked by methotrexate, enters the cells via the same active transport system as methotrexate. Stabilizes the binding of 5-dUMP and thymidylate synthetase, enhancing the activity of fluorouracil.

Methanol toxicity treatment: Formic acid (methanol’s toxic metabolite) is normally metabolized to carbon dioxide and water by 10-formyltetrahydrofolate dehydrogenase after being bound to tetrahydrofolate. Administering a source of tetrahydrofolate may aid the body in eliminating formic acid.

Pharmacodynamics/Kinetics

Absorption: Oral, I.M.: Well absorbed

Metabolism: Intestinal mucosa and hepatically to 5-methyl-tetrahydrofolate (5MTHF; active)

Bioavailability: Saturable at oral doses >25 mg; 25 mg (97%), 50 mg (75%), 100 mg (37%)

Half-life elimination: ~4-8 hours

Time to peak: Oral: ~2 hours; I.V.: Total folates: 10 minutes; 5MTHF: ~1 hour

Excretion: Urine (primarily); feces

Medication Safety Issues

Sound-alike/look-alike issues:

Lupron® may be confused with Nuprin®

Lupron Depot®-3 Month may be confused with Lupron Depot-Ped®

Pronunciation(loo PROE lide)

U.S. Brand NamesEligard®; Lupron Depot-Ped®; Lupron Depot®; Lupron®; Viadur® [DSC]

Canadian Brand NamesEligard®; Lupron®; Lupron® Depot®; Viadur®

Pharmacologic CategoryAntineoplastic Agent, Gonadotropin-Releasing Hormone Agonist; Gonadotropin Releasing Hormone Agonist

Use: Labeled IndicationsPalliative treatment of advanced prostate cancer; management of endometriosis; treatment of anemia caused by uterine leiomyomata (fibroids); central precocious puberty

Use: Unlabeled/InvestigationalTreatment of breast, ovarian, and endometrial cancer; infertility; prostatic hyperplasia

Dosing: Adults

Advanced prostate cancer:

SubQ:

Eligard®: 7.5 mg monthly **or** 22.5 mg every 3 months **or** 30 mg every 4 months **or** 45 mg every 6 months

Lupron®: 1 mg/day

Viadur®: 65 mg implanted subcutaneously every 12 months

I.M.:

Lupron Depot®: 7.5 mg/dose given monthly (every 28-33 days) **or**

Lupron Depot®-3: 22.5 mg every 3 months **or**

Lupron Depot®-4: 30 mg every 4 months

Breast cancer, premenopausal ovarian ablation (unlabeled use): I.M.:

Lupron Depot®: 3.75 mg every 28 days **or**

Lupron Depot®-3: 11.25 mg every 3 months

Endometriosis: I.M.: Initial therapy may be with leuprolide alone or in combination with norethindrone; if retreatment for an additional 6 months is necessary, norethindrone should be used. Retreatment is not recommended for longer than one additional 6-month course.

Lupron Depot®: 3.75 mg/month for up to 6 months **or**

Lupron Depot®-3: 11.25 mg every 3 months for up to 2 doses (6 months total duration of treatment)

Uterine leiomyomata (fibroids): I.M. (in combination with iron):

Lupron Depot®: 3.75 mg/month for up to 3 months **or**

Lupron Depot®-3: 11.25 mg as a single injection

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Precocious puberty (consider discontinuing by age 11 for females and by age 12 for males):

SubQ (Lupron®): Initial: 50 mcg/kg/day (per manufacturer, doses of 20-45 mcg/kg/day have also been reported); titrate dose upward by 10 mcg/kg/day if down-regulation is not achieved

I.M. (Lupron Depot-Ped®): 0.3 mg/kg/dose given every 28 days (minimum dose: 7.5 mg)

≤25 kg: 7.5 mg

>25-37.5 kg: 11.25 mg

>37.5 kg: 15 mg

Titrate dose upward in increments of 3.75 mg every 4 weeks if down-regulation is not achieved.

Dosing: Combination Regimens

Prostate cancer:

Bicalutamide + LHRH-A

FL

Administration: I.M.Lupron Depot®: Vary injection site periodically

Administration: Other

SubQ:

Eligard®: Vary injection site; choose site with adequate subcutaneous tissue (eg, abdomen, upper buttocks)

Lupron®: Vary injection site; if an alternate syringe from the syringe provided is required, insulin syringes should be used

Implant (Viadur®): Requires surgical implantation (subcutaneous) and removal at 12-month intervals

Storage

Lupron®: Store unopened vials of injection in refrigerator, vial in use can be kept at room temperature of ≤30°C (86°F) for several months with minimal loss of potency. Protect from light and store vial in carton until use. Do not freeze.

Eligard®: Store at 2°C to 8°C (36°F to 46°C). Allow to reach room temperature prior to using; once mixed, must be administered within 30 minutes.

Lupron Depot® may be stored at room temperature of 15°C to 30°C (59°F to 86°F). Upon reconstitution, the suspension does not contain a preservative and should be used immediately.

Viadur® may be stored at room temperature of 15°C to 30°C (59°F and 86°F).

Reconstitution

Eligard®: Packaged in two syringes; one contains the Atrigel® polymer system and the second contains leuprolide acetate powder; follow package instructions for mixing

Lupron Depot®: Reconstitute only with diluent provided

ContraindicationsHypersensitivity to leuprolide, GnRH, GnRH-agonist analogs, or any component of the formulation; undiagnosed abnormal vaginal bleeding; pregnancy; breast-feeding

Lupron Depot®-4 month (30 mg) is not indicated for use in women

Eligard® and Viadur® are contraindicated in women and children

Allergy Considerations

- GnRH Agonist Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Abnormal menses: Females treated for precocious puberty may experience menses or spotting during the first 2 months of treatment; notify healthcare provider if bleeding continues after the second month.
- Decreased bone density: Has been reported when used for ≥6 months.
- Endometriosis: Exacerbation of endometriosis or uterine leiomyomata may occur initially.
- Pituitary apoplexy: Rare cases of pituitary apoplexy (frequently secondary to pituitary adenoma) have been observed with leuprolide administration (onset from 1 hour to usually <2 weeks); may present as sudden headache, vomiting, visual or mental status changes, and infrequently cardiovascular collapse; immediate medical attention required.
- Spinal cord compression: Has been reported when used for prostate cancer; closely observe patients for weakness and paresthesias in first few weeks of therapy. Observe patients with metastatic vertebral lesions closely.
- Tumor flare: Transient increases in testosterone can lead to tumor flare, bone pain, hematuria, bladder outlet obstruction and neuropathy in prostate cancer patients during the first few weeks of therapy.
- Urinary tract obstruction: Has been reported when used for prostate cancer; closely observe patients for urinary tract obstruction and hematuria in first few weeks of therapy. Observe patients with urinary obstruction closely.

Disease-related concerns:

- Psychiatric illness: Use with caution in patients with a history of psychiatric illness; alteration in mood, memory impairment, and depression have been associated with use.

Dosage form specific issues:

- Vehicle used in injectable (polylactide-co-glycolide microspheres): Has rarely been associated with retinal artery occlusion in patients with abnormal arteriovenous anastomosis (eg, patent foramen ovale).

Geriatric ConsiderationsLeuprolide has the advantage of not increasing risk of atherosclerotic vascular disease, causing swelling of breasts, fluid retention, and thromboembolism as compared to estrogen therapy.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy must be excluded prior to the start of treatment. Although leuprolide usually inhibits ovulation and stops menstruation, contraception is not ensured and a nonhormonal contraceptive should be used. Fetal abnormalities and increased fetal mortality have been noted in animal studies.

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

Children:

2% to 10%:

Central nervous system: Pain (2%)

Dermatologic: Acne (2%), rash (2% including erythema multiforme), seborrhea (2%)

Genitourinary: Vaginitis (2%), vaginal bleeding (2%), vaginal discharge (2%)

Local: Injection site reaction (5%)

<2%: Alopecia, body odor, cervix disorder, dysphagia, emotional lability, epistaxis, fever, gingivitis, gynecomastia, headache, nausea, nervousness, peripheral edema, personality disorder, sexual maturity accelerated, skin striae, somnolence, syncope, urinary incontinence, vasodilation, vomiting, weight gain

Adults: Note: For prostate cancer treatment, an initial rise in serum testosterone concentrations may cause “tumor flare” or worsening of symptoms, including bone pain, neuropathy, hematuria, or ureteral or bladder outlet obstruction during the first 2 weeks. Similarly, an initial increase in estradiol levels, with a temporary worsening of symptoms, may occur in women treated with leuprolide.

Delayed release formulations:

10%:

Cardiovascular: Edema (≤14%)

Central nervous system: Headache (≤65%), pain (<2% to 33%), depression (≤31%), insomnia (≤31%), fatigue (≤17%), dizziness/vertigo (≤16%)

Dermatologic: Skin reaction (≤12%)

Endocrine & metabolic: Hot flashes (25% to 98%), testicular atrophy (≤20%), hyperlipidemia (≤12%), libido decreased (≤11%)

Gastrointestinal: Nausea/vomiting (≤25%), weight gain/loss (≤13%)

Genitourinary: Vaginitis (11% to 28%), urinary disorder (13% to 15%)

Local: Implant site bruising (35%), injection site burning/stinging (transient: ≤35%)

Neuromuscular & skeletal: Joint disorder (≤12%), weakness (≤12%)

Miscellaneous: Flu-like syndrome (≤12%)

1% to 10% (limited to important or life-threatening):

Cardiovascular: Angina (<5%), arrhythmia (<5%), atrial fibrillation (<5%), bradycardia (<5%), CHF (<5%), deep thrombophlebitis (<5%), hyper-/hypotension (<5%), palpitation (<5%), syncope (<5%), tachycardia (<5%)

Central nervous system: Nervousness (≤8%), anxiety (≤6%), confusion (<5%), delusions (<5%), dementia (<5%), fever (<5%), seizure (<5%)

Dermatologic: Acne (≤10%), alopecia (≤5%), bruising (≤5%), cellulitis (<5%), pruritus (≤3%), hirsutism (<2%), rash (<2%)

Endocrine & metabolic: Dehydration (≤8%), gynecomastia (≤7%), breast tenderness/pain (≤6%), bicarbonate decreased (≥5%), hyper-/hypocholesterolemia (≥5%), hyperglycemia (≥5%), hyperphosphatemia (≥5%), hyperuricemia (≥5%), hypoalbuminemia (≥5%), hypoproteinemia (≥5%), lactation (<5%), testicular pain (≤4%), menstrual disorder (≤2%)

Gastrointestinal: Dysphagia (<5%), gastrointestinal hemorrhage (<5%), intestinal obstruction (<5%), ulcer (<5%), gastroenteritis/colitis (≤3%), diarrhea (≤2%), constipation (≤2%)

Genitourinary: Prostatic acid phosphatase increased/decreased (≥5%), urine specific gravity increased/decreased (≥5%), impotence (≤5%), balanitis (<5%), incontinence (<5%), penile/testis disorder (<5%), urinary tract infection (<5%), nocturia (≤4%), polyuria (2% to 4%), bladder spasm (<2%), dysuria (<2%), erectile dysfunction (<2%), hematuria (<2%), urinary retention (<2%), urinary urgency (<2%)

Hematologic: Eosinophilia (≥5%), leukopenia (≥5%), platelets increased (≥5%), anemia

Hepatic: Liver function tests abnormal (≥5%), partial thromboplastin time increased (≥5%), prothrombin time increased (≥5%), hepatomegaly (<5%)

Local: Implant site reaction (persistent or delayed: 9% to 10%), implant site burning (6%), injection site pain (2% to 5%), injection site erythema (1% to 3%)

Neuromuscular & skeletal: Myalgia (≤8%), paresthesia (≤8%), neuropathy (<5%), paralysis (<5%), pathologic fracture (<5%), bone pain (<2%)

Renal: BUN increased (≥5%), creatinine increased (≥5%)

Respiratory: Emphysema (<5%), epistaxis (<5%), hemoptysis (<5%), pleural effusion (<5%), pulmonary edema (<5%), dyspnea (≤2%)

Miscellaneous: Diaphoresis (≤5%), allergic reaction (<5%), infection (5%), lymphadenopathy (<5%)

Immediate release formulation:

>10%:

Cardiovascular: ECG changes/ischemia (19%), peripheral edema (12%)

Central nervous system: Pain (13%)

Endocrine & metabolic: Hot flashes (55%)

1% to 10% (limited to important or life-threatening):

Cardiovascular: Hypertension (8%), murmur (3%), thrombosis/phlebitis (2%), CHF (1%), angina, arrhythmia, MI, syncope

Central nervous system: Headache (7%), insomnia (7%), dizziness/lightheadedness (5%), anxiety, depression, fatigue, fever, nervousness

Dermatologic: Dermatitis (5%), alopecia, bruising, itching, lesions, pigmentation

Endocrine & metabolic: Gynecomastia/breast tenderness/pain (7%), testicular size decreased (7%), diabetes, hypercalcemia, hypoglycemia, libido decreased, thyroid enlarged

Gastrointestinal: Constipation (7%), anorexia (6%), nausea/vomiting (5%), diarrhea, dysphagia, gastrointestinal bleeding, peptic ulcer, rectal polyps

Genitourinary: Urinary frequency/urgency (6%), impotence (4%), urinary tract infection (3%), bladder spasm, dysuria, incontinence, testicular pain, urinary obstruction

Hematologic: Anemia (5%)

Local: Injection site reaction

Neuromuscular & skeletal: Weakness (10%), bone pain (5%), peripheral neuropathy

Ocular: Blurred vision

Renal: Hematuria (6%), BUN increased, creatinine increased

Respiratory: Dyspnea (2%), cough, pneumonia, pulmonary embolus, pulmonary fibrosis

Miscellaneous: Infection, inflammation

Children and Adults:*Any formulations:* Postmarketing and/or case reports (limited to important or life-threatening): Anaphylactic/anaphylactoid reactions, asthmatic reactions, bone density decreased; fibromyalgia-like symptoms (arthralgia/myalgia, headaches, GI distress); hemoptysis, hepatic dysfunction, hypokalemia, hypoproteinemia, implant extrusion, implant migration, injection site induration/abscess, MI, pelvic fibrosis, penile swelling, photosensitivity; pituitary apoplexy (cardiovascular collapse, mental status altered, ophthalmoplegia, sudden headache, visual changes, vomiting); prostate pain, pulmonary embolism, pulmonary infiltrate, spinal fracture/paralysis, stroke, tenosynovitis-like symptoms, thrombocytopenia, transient ischemia attack, uric acid increased, urticaria, WBC increased

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Antidiabetic Agents: Luteinizing Hormone-Releasing Hormone Analogs may diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Test InteractionsInterferes with pituitary gonadotropic and gonadal function tests during and up to 3 months after monthly administration of leuprolide therapy. Viadur®: Efficacy and stability of product not affected by MRI or radiographic exposure, although device will be visualized during these diagnostic procedures.
Monitoring ParametersBone mineral density

Precocious puberty: GnRH testing (blood LH and FSH levels), measurement of bone age every 6-12 months, testosterone in males and estradiol in females; Tanner staging

Prostatic cancer: LH and FSH levels, serum testosterone (2-4 weeks after initiation of therapy), PSA; weakness, paresthesias, and urinary tract obstruction in first few weeks of therapy

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, weakness, paresthesias, and urinary tract obstruction in first few weeks of therapy) on a regular basis throughout therapy. Teach patient (or caregiver) proper use (eg, storage, injection technique, syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment and do not give to females of childbearing age unless capable of complying with contraceptive measures 1 month prior to therapy, during therapy, and 1 month following therapy. Instruct patient in appropriate contraceptive measures.

Monitoring: Lab TestsPrecocious puberty: GnRH testing (blood LH and FSH levels), testosterone in males and estradiol in females

Patient EducationUse as directed. Do not discontinue without consulting prescriber. You may experience disease flare (increased bone pain) and urinary retention during early treatment (usually resolves); dizziness, headache, lethargy, or faintness (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small frequent meals or analgesics may help); hot flashes, flushing, or redness (cold cloth and cool environment may help); breast swelling or tenderness; or decreased libido. Report irregular or rapid heartbeat, palpitations, chest pain; shortness or breath; swelling of extremities; unexplained weight gain of 3-5 pounds/week; inability to void or changes in urinary pattern; unresolved nausea or vomiting; numbness of extremities; breast swelling or pain, respiratory difficulty, or redness, swelling or pain at injection sites. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant. Consult prescriber for appropriate contraceptive use during and for a time following therapy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Implant, subcutaneous:

- Viadur®: 65 mg [released over 12 months; packaged with administration kit] [DSC]

Injection, solution, as acetate: 5 mg/mL (2.8 mL)

- Lupron®: 5 mg/mL (2.8 mL) [contains benzyl alcohol; packaged with syringes and alcohol swabs]

Injection, powder for reconstitution, as acetate [depot formulation]:

- Eligard®:
  - 7.5 mg [released over 1 month; contains polylactide-co-glycolide]

Mechanism of ActionLeuprolide, is an agonist of luteinizing hormone-releasing hormone (LHRH). Acting as a potent inhibitor of gonadotropin secretion; continuous administration results in suppression of ovarian and testicular steroidogenesis due to decreased levels of LH and FSH with subsequent decrease in testosterone (male) and estrogen (female) levels. In males, testosterone levels are reduced to below castrate levels. Leuprolide may also have a direct inhibitory effect on the testes, and act by a different mechanism not directly related to reduction in serum testosterone.

Pharmacodynamics/Kinetics

Onset of action: Following transient increase, testosterone suppression occurs in ~2-4 weeks of continued therapy

Distribution: Males: V_d: 27 L

Protein binding: 43% to 49%

Metabolism: Major metabolite, pentapeptide (M-1)

Bioavailability: Oral: None; SubQ: 94%

Excretion: Urine (<5% as parent and major metabolite)

Related Information

FDA Advisory: Transition to HFA-Propelled Albuterol Inhalers - June 2008

The Food and Drug Administration (FDA) has issued a Public Health Advisory to announce a phase out of albuterol chlorofluorocarbon (CFC) propelled inhalers to hydrofluoralkane (HFA) propelled albuterol inhalers. The CFC propelled albuterol inhalers will not be available in the U.S. after December 31, 2008, and patients should be transitioned to a hydrofluoralkane (HFA) propelled albuterol inhaler now. To date, the three HFA-propelled albuterol inhalation aerosol inhalers on the market include ProAir™ HFA, Proventil® HFA, and Ventolin® HFA. In addition, levalbuterol, the (R) enantiomer of racemic albuterol, is also available as Xoponex HFA™ inhalation aerosol.

This national transition from CFC-propelled inhalers to HFA-propelled inhalers is ongoing and other medications using CFC-propelled inhalers will be phased out over the next several years.

Additional information may be found at http://www.fda.gov/cder/drug/advisory/albuterol_cfc.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Xopenex® may be confused with Xanax®

Pronunciation(leve al BYOO ter ole)

U.S. Brand NamesXopenex HFA™; Xopenex®

Canadian Brand NamesXopenex®

Pharmacologic CategoryBeta$_2$ Agonist

Use: Labeled IndicationsTreatment or prevention of bronchospasm in children and adults with reversible obstructive airway disease

Dosing: Adults

Bronchospasm:

Metered-dose inhaler: 2 puffs every 4-6 hours

Solution for nebulization: 0.63 mg 3 times/day at intervals of 6-8 hours; dosage may be increased to 1.25 mg 3 times/day with close monitoring for adverse effects

Exacerbation of asthma (acute, severe)*(NIH Guidelines, 2007):*

Metered-dose inhaler: 4-8 puffs every 20 minutes for up to 4 hours, then every 1-4 hours as needed

Solution for nebulization: 1.25-2.5 mg every 20 minutes for 3 doses, then 1.25-5 mg every 1-4 hours as needed

Dosing: ElderlyOnly a small number of patients have been studied. Although greater sensitivity of some elderly patients cannot be ruled out, no overall differences in safety or effectiveness were observed. An initial dose of 0.63 mg should be used in all patients >65 years of age.

Dosing: Pediatric

Bronchospasm:

Metered-dose inhaler: Children ≥4 years: 2 puffs every 4-6 hours as needed

Solution for nebulization:

Children ≤4 years (NIH Guidelines, 2007): 0.31-1.25 mg every 4-6 hours as needed

Children 5-11 years (NIH Guidelines, 2007): 0.31-0.63 mg 3 times/day as needed

Children ≥12 years: 0.63-1.25 mg every 8 hours as needed

Exacerbation of asthma (acute, severe)*(NIH Guidelines, 2007):*

Metered-dose inhaler: Children ≥4 years: 4-8 puffs every 20 minutes for 3 doses, then every 1-4 hours as needed

Solution for nebulization:

Children <12 years: 0.075 mg/kg (minimum: 1.25 mg) every 20 minutes for 3 doses, then 0.075-0.15 mg/kg (maximum: 5 mg) every 1-4 hours as needed

Children ≥12 years: 1.25-2.5 mg every 20 minutes for 3 doses, then 1.25-5 mg every 1-4 hours as needed

Administration: Inhalation

Metered-dose inhaler: Shake well before use; prime with 4 test sprays prior to first use or if inhaler has not been use of more than 3 days. Clean actuator (mouthpiece) weekly. A spacer device or valved holding chamber is recommended when using a metered-dose inhaler.

Solution for nebulization: Safety and efficacy were established when administered with the following nebulizers: PARI LC Jet™, PARI LC Plus™, as well as the following compressors: PARI Master®, Dura-Neb® 2000, and Dura-Neb® 3000. Concentrated solution should be diluted prior to use. Blow-by administration is not recommended, use a mask device if patient unable to hold mouthpiece in mouth for administration.

Storage

Aerosol: Store at room temperature of 20°C to 25°C (68°F to 77°F); protect from freezing and direct sunlight. Store with mouthpiece down. Discard after 200 actuations.

Solution for nebulization: Store in protective foil pouch at room temperature of 20°C to 25°C (68°F to 77°F). Protect from light and excessive heat. Vials should be used within 2 weeks after opening protective pouch. Use within 1 week and protect from light if removed from pouch. Vials of concentrated solution should be used immediately after removing from protective pouch.

ReconstitutionConcentrated solution should be diluted with 2.5 mL NS prior to use.

CompatibilitySolution for nebulization:**Compatible** with budesonide suspension

ContraindicationsHypersensitivity to levalbuterol, albuterol, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.
- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.

Disease-related concerns:

- Asthma: Appropriate use: Optimize anti-inflammatory treatment before initiating maintenance treatment with levalbuterol. Do not use as a component of chronic therapy without an anti-inflammatory agent. Only the mildest form of asthma (Step 1 and/or exercise-induced) would not require concurrent use based upon asthma guidelines.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia or hypertension or HF); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias.
- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.
- Glaucoma: Use with caution in patients with glaucoma; may elevate intraocular pressure.
- Hyperthyroidism: Use with caution in hyperthyroidism; may stimulate thyroid activity.
- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$-agonists may decrease serum potassium.
- Seizures: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <4 years of age.

Other warnings/precautions:

- Appropriate use: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.
- Patient information: Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use may indicate deterioration of asthma, and treatment must not be delayed. A spacer device or valved holding chamber is recommended when using a metered-dose inhaler.

Geriatric ConsiderationsFor aerosol formulation, start with low end of dosage range. Refer to dosing information for nebulization dosing specifics.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, racemic albuterol was teratogenic in some species. There are no adequate and well-controlled studies in pregnant women. This drug should be used during pregnancy only if benefit exceeds risk. Use caution if needed for bronchospasm during labor and delivery; has potential to interfere with uterine contractions.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known whether levalbuterol is excreted in human milk. Plasma levels following oral inhalation are low. Racemic albuterol was shown to be tumorigenic in animal studies.

Adverse Reactions

>10%:

Endocrine & metabolic: Serum glucose increased, serum potassium decreased

Neuromuscular & skeletal: Tremor (≤7%)

Respiratory: Rhinitis (3% to 11%)

Miscellaneous: Viral infection (7% to 12%)

>2% to 10%:

Central nervous system: Headache (8% to 12%), nervousness (3% to 10%), dizziness (1% to 3%), anxiety (≤3%), migraine (≤3%), weakness (3%)

Cardiovascular: Tachycardia (~3%)

Dermatologic: Rash (≤8%)

Gastrointestinal: Diarrhea (2% to 6%), dyspepsia (1% to 3%)

Neuromuscular & skeletal: Leg cramps (≤3%)

Respiratory: Asthma (9%), pharyngitis (3% to 10%), cough (1% to 4%), sinusitis (1% to 4%), nasal edema (1% to 3%)

Miscellaneous: Flu-like syndrome (1% to 4%), accidental injury (≤3%)

<2%: Abnormal ECG, acne, anaphylaxis, angina, angioedema, arrhythmia, atrial fibrillation, chest pain, chills, constipation, conjunctivitis, cough, diaphoresis, dysmenorrhea, dyspnea, epistaxis, extrasystole, gastroenteritis, hematuria, hyper-/hypotension, hypoesthesia (hand), hypokalemia, insomnia, itching eyes, lymphadenopathy, myalgia, nausea, oropharyngeal dryness, paresthesia, supraventricular arrhythmia, syncope, vaginal moniliasis, vertigo, vomiting, wheezing, xerostomia

Note: Immediate hypersensitivity reactions have occurred (including angioedema, oropharyngeal edema, urticaria, and anaphylaxis).

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Monitoring ParametersAsthma symptoms; FEV_1, peak flow, and/or other pulmonary function tests; heart rate, blood pressure, CNS stimulation; arterial blood gases (if condition warrants); serum potassium, serum glucose (in selected patients)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness (patient response and laboratory values), adverse reactions (eg, anaphylaxis or hypertension, first dose administered under supervision), or overdose. Patients with diabetes should monitor serum glucose on a regular basis (possibility of hyperglycemia). Assess knowledge/teach patient appropriate use (safe use of nebulizer), interventions to reduce side effects, and adverse reactions to report.

Monitoring: Lab TestsFEV_1 and/or peak expiratory flow rate, arterial blood gases (if condition warrants); serum potassium, serum glucose (in selected patients)

Patient EducationUse only when necessary or as prescribed; tolerance may develop with overuse. Do not administer more frequently than prescribed. First dose should not be used when you are alone. Avoid OTC medications without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Stress or excessive exercising may exacerbate wheezing or bronchospasm (controlled breathing or relaxation techniques may help). If you have diabetes, you will need to monitor serum glucose levels closely until response is known; notify diabetic advisor if hyperglycemia occurs. You may experience tremor, anxiety, or dizziness (use caution when driving or engaging in hazardous activities until response to drug is known); headache; or temporarily upset stomach, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Paradoxical bronchospasm can occur. Stop drug immediately and notify prescriber if any of the following occur: chest pain, tightness, palpitations; severe headache; respiratory difficulty; increased nervousness, restlessness, or trembling; muscle cramps or weakness; or seizures. Report unusual signs of flu or infection, leg or muscle cramps, unusual cough, persistent GI problems, vision changes, or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strength expressed as base.

Aerosol, for oral inhalation, as tartrate:

Xopenex HFA™: 45 mcg/actuation (15 g) [200 actuations; chlorofluorocarbon free]

Solution for nebulization, as hydrochloride [preservative free]:

Xopenex®: 0.31 mg/3 mL (24s); 0.63 mg/3 mL (24s); 1.25 mg/3 mL (24s)

Solution for nebulization, as hydrochloride [concentrate; preservative free]:

Xopenex®: 1.25 mg/0.5 mL (30s)

Generic AvailableNo

ManufacturerSepracor, Inc

Pricing: U.S. (www.drugstore.com)

Aerosol (Xopenex HFA)

45 mcg/ACT (15): $53.84

Nebulization (Xopenex)

0.31 mg/3 mL (72): $100.11

0.63 mg/3 mL (72): $102.78

1.25 mg/3 mL (72): $101.59

Mechanism of ActionRelaxes bronchial smooth muscle by action on beta$_2$-receptors with little effect on heart rate

Pharmacodynamics/Kinetics

Onset of action (as measured by a 15% increase in FEV$_1$):

Aerosol: 5.5-10.2 minutes

Peak effect: ~77 minutes

Nebulization: 10-17 minutes

Peak effect: 1.5 hours

Duration (as measured by a 15% increase in FEV$_1$):

Aerosol: 3-4 hours (up to 6 hours in some patients)

Nebulization: 5-6 hours (up to 8 hours in some patients)

Absorption: A portion of inhaled dose is absorbed to systemic circulation

Half-life elimination: 3.3-4 hours

Time to peak, serum:

Aerosol: Children: 0.8 hours, Adults: 0.5 hours

Nebulization: Children: 0.3-0.6 hours, Adults: 0.2 hours

Related Information

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled IndicationsAdjunctive therapy in the treatment of partial onset, myoclonic, and/or primary generalized tonic-clonic seizures

Use: Unlabeled/InvestigationalBipolar disorder

Dosing: Adults

Myoclonic seizures: Oral: Immediate release: Initial: 500 mg twice daily; may increase every 2 weeks by 500 mg/dose to the recommended dose of 1500 mg twice daily. Efficacy of doses >3000 mg/day has not been established.

Partial onset seizures:

Oral:

Immediate release: Initial: 500 mg twice daily; may increase every 2 weeks by 500 mg/dose to a maximum of 1500 mg twice daily. Doses >3000 mg/day have been used in trials; however, there is no evidence of increased benefit.

Extended release: Initial: 1000 mg once daily; may increase every 2 weeks by 1000 mg/day to a maximum of 3000 mg once daily.

I.V.: Initial: 500 mg twice daily; may increase every 2 weeks by 500 mg/dose to a maximum of 1500 mg twice daily. Doses >3000 mg/day have been used in trials; however, there is no evidence of increased benefit.

Note: When switching from oral to I.V. formulations, the total daily dose should be the same.

Tonic-clonic seizures: Oral: Immediate release: Initial: 500 mg twice daily; may increase every 2 weeks by 500 mg/dose to the recommended dose of 1500 mg twice daily. Efficacy of doses >3000 mg/day has not been established.

Bipolar disorder (unlabeled use): Oral: Immediate release: Initial: 500 mg twice daily; if tolerated, increase by 500 mg twice daily; dose may be increased every 3 days until target dose of 3000 mg/day is reached; maximum: 4000 mg/day

Loading dose (unlabeled): Immediate release: Initial doses of 1500-2000 mg have been well-tolerated (Koubeissi, 2008; Betts, 2000), although the necessity of a loading dose has not been established

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Myoclonic seizures: Oral: Children ≥12 years: Immediate release: Initial: 500 mg twice daily; may increase every 2 weeks by 500 mg/dose to the recommended dose of 1500 mg twice daily. Efficacy of doses >3000 mg/day has not been established.

Partial onset seizures: Oral:

Children 4-15 years: Partial onset seizures: Immediate release: 10 mg/kg/dose given twice daily; may increase every 2 weeks by 10 mg/kg/dose to a maximum of 30 mg/kg/dose twice daily

Children ≥16 years: Refer to adult dosing.

Tonic-clonic seizures: Oral:

Children 6-15 years: Immediate release: Initial: 10 mg/kg dose given twice daily; may increase every 2 weeks by 10 mg/kg/dose to the recommended dose of 30 mg/kg twice daily. Efficacy of doses >60 mg/kg/day has not been established.

Children ≥16 years: Refer to adult dosing.

Bipolar disorder (unlabeled use): Oral: Children ≥16 years: Refer to adult dosing.

Dosing: Renal ImpairmentAdults:

Immediate release and I.V. formulations:

Cl_{cr} >80 mL/minute: 500-1500 mg every 12 hours

Cl_{cr} 50-80 mL/minute: 500-1000 mg every 12 hours

Cl_{cr} 30-50 mL/minute: 250-750 mg every 12 hours

Cl_{cr} <30 mL/minute: 250-500 mg every 12 hours

End-stage renal disease patients using dialysis: 500-1000 mg every 24 hours; a supplemental dose of 250-500 mg following dialysis is recommended

Extended release tablets:

Cl_{cr} >80 mL/minute: 1000-3000 mg every 24 hours

Cl_{cr} 50-80 mL/minute: 1000-2000 mg every 24 hours

Cl_{cr} 30-50 mL/minute: 500-1500 mg every 24 hours

Cl_{cr} <30 mL/minute: 500-1000 mg every 24 hours

Dosing: Hepatic ImpairmentNo adjustment required

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Infuse over 15 minutes

Administration: I.V. DetailpH: 5.5

Administration: Oral

May be taken with or without food.

Oral solution: Should be administered with a calibrated measuring device (not a household teaspoon or tablespoon)

Tablet (immediate release and extended release): Only administer as whole tablet; do not crush, break or chew.

Dietary ConsiderationsMay be taken with or without food.

Storage

Oral solution, tablets: Store at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

Injection solution: Store at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Admixed solution is stable for 24 hours in PVC bags kept at room temperature.

Reconstitution

Injection solution: Must dilute dose in 100 mL of NS, LR, or D_5W.

Compatibility

Stable in NS, LR, D_5W

Compatibility when admixed: Compatible: Diazepam, lorazepam, valproic acid

ContraindicationsHypersensitivity to levetiracetam or any component of the formulation

Allergy Considerations

- Levetiracetam Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Weakness, dizziness, and somnolence occur mostly during the first month of therapy.

- Hematologic effects: Although rare, decreases in red blood cell counts, hemoglobin, hematocrit, white blood cell counts and neutrophils have been observed.

- Psychotic symptoms: Psychosis, hallucinations and behavioral symptoms (including aggression, anger, anxiety, depersonalization, depression, personality disorder) may occur; dose reduction may be required.

Disease-related concerns:

- Renal impairment: Use caution with renal impairment; dosage adjustment may be necessary.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <4 years of age (oral formulation) or <16 years (I.V. formulation and extended release tablets). Children may have increased incidence of psychotic symptoms; dose reduction may be required.

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsIn a study of 16 older adults (61-88 years of age) receiving levetiracetam daily and with creatinine clearances ranging from 30-74 mL/minute, a decrease in creatinine clearance (38%) and a 2.5 hour longer half-life were recorded in the elderly compared to younger adults. The authors concluded that the difference was due to renal function. Other studies show no overall difference in safety and efficacy, although larger numbers in studies are needed to verify efficacy. Levetiracetam has demonstrated a low incidence of cognitive effects. When using the drug in elderly, it is essential to base the dose on estimated creatinine clearance and adjust appropriately.

Pregnancy Risk FactorC

Pregnancy ConsiderationsDevelopmental toxicities were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Two registries are available for women exposed to levetiracetam during pregnancy:

Antiepileptic Drug Pregnancy Registry (888-233-2334 or http://www.mgh.harvard.edu/aed/)

Keppra® pregnancy registry (888-537-7734 or http://www.keppra.com)

LactationEnters breast milk/not recommended

Adverse Reactions

>10%:

Central nervous system: Behavioral symptoms (agitation, aggression, anger, anxiety, apathy, depersonalization, depression, emotional lability, hostility, hyperkinesias, irritability, nervousness, neurosis and personality disorder: adults 5% to 13%; children 5% to 38%), somnolence (8% to 23%), headache (14%), hostility (2% to 12%)

Gastrointestinal: Vomiting (15%), anorexia (3% to 13%)

Neuromuscular & skeletal: Weakness (9% to 15%)

Respiratory: Pharyngitis (6% to 14%), rhinitis (4% to 13%), cough (2% to 11%)

Miscellaneous: Accidental injury (17%), infection (2% to 13%)

1% to 10%:

Cardiovascular: Facial edema (2%)

Central nervous system: Fatigue (10%), nervousness (4% to 10%), dizziness (5% to 9%), personality disorder (8%), pain (6% to 7%), agitation (6%), irritability (6% to 7%), emotional lability (2% to 6%), mood swings (5%), depression (3% to 5%), vertigo (3% to 5%), ataxia (3%), amnesia (2%), anxiety (2%), confusion (2%)

Dermatologic: Bruising (4%), pruritus (2%), rash (2%), skin discoloration (2%)

Endocrine & metabolic: Dehydration (2%)

Gastrointestinal: Diarrhea (8%), nausea (5%), gastroenteritis (4%), constipation (3%)

Genitourinary: Urine abnormality (2%)

Hematologic: Leukocytes decreased (2% to 3%)

Neuromuscular & skeletal: Neck pain (2% to 8%), paresthesia (2%), reflexes increased (2%)

Ocular: Conjunctivitis (3%), diplopia (2%), amblyopia (2%)

Otic: Ear pain (2%)

Renal: Albuminuria (4%)

Respiratory: Influenza (5%), asthma (2%), sinusitis (2%)

Miscellaneous: Flu-like syndrome (3% to 8%), viral infection (2%)

<1%, postmarketing and/or case reports: Alopecia, anemia, catatonia, hematocrit decreased, hemoglobin decreased, hepatic failure, hepatitis, leukopenia, LFTs abnormal, neutropenia, pancreatitis, pancytopenia (with bone marrow suppression), psychotic symptoms, red blood cells decreased, suicide attempt, suicide behavior, suicide ideation, thrombocytopenia, weight loss

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Food may delay, but does not affect the extent of absorption.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor therapeutic effectiveness, laboratory values, and adverse reactions at beginning of therapy and periodically with long-term use. Monitor for CNS depression (somnolence and fatigue), behavioral abnormalities (psychosis, hallucinations, psychotic depression), and other behavioral symptoms (agitation, anger, aggression, irritability, hostility, anxiety, apathy, emotional lability, depersonalization, and depression). Taper dosage slowly when discontinuing. Observe and teach seizure/safety precautions. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or nausea, vomiting, loss of appetite, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Wear identification of epileptic status and medications. Report CNS changes, mentation changes, suicidal ideation, depression, or changes in cognition; muscle cramping, weakness, tremors, changes in gait; persistent GI symptoms (cramping, constipation, vomiting, anorexia); rash or skin irritations; unusual bruising or bleeding (mouth, urine, stool); or worsening of seizure activity or loss of seizure control. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Keppra®: 100 mg/mL (5 mL)

Solution, oral:

Keppra®: 100 mg/mL (480 mL) [dye free; grape flavor]

Tablet: 250 mg, 500 mg, 750 mg

Keppra®: 250 mg, 500 mg, 750 mg, 1000 mg

Tablet, extended release:

Keppra XR™: 500 mg

1000 mg (60): $450.32

Tablets (Levetiracetam)

250 mg (120): $245.98

500 mg (30): $85.99

750 mg (120): $399.97

Mechanism of Action The precise mechanism by which levetiracetam exerts its antiepileptic effect is unknown. However, several studies have suggested the mechanism may involve one or more of the following central pharmacologic effects: inhibition of voltage-dependent N-type calcium channels; facilitation of GABA-ergic inhibitory transmission through displacement of negative modulators; reduction of delayed rectifier potassium current; and/or binding to synaptic proteins which modulate neurotransmitter release.

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid and almost complete

Distribution: V_d: Similar to total body water

Protein binding: <10%

Metabolism: Not extensive; primarily by enzymatic hydrolysis; forms metabolites (inactive)

Bioavailability: 100%

Half-life elimination: ~6-8 hours; extended release tablet: ~7 hours; half-life increased in renal dysfunction

Time to peak, plasma: Oral: Immediate release: ~1 hour; Extended release: ~4 hours

Excretion: Urine (66% as unchanged drug)

Levobunolol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Levobunolol may be confused with levocabastine

Betagan® may be confused with Betadine®, Betoptic® S

International issues:

Betagan® may be confused with Betagon® which is a brand name for mepindolol in Italy

Pronunciation(lee voe BYOO noe lole)

U.S. Brand Names Betagan®

Canadian Brand Names Apo-Levobunolol®; Betagan®; Novo-Levobunolol; Optho-Bunolol®; PMS-Levobunolol; Sandoz-Levobunolol

Pharmacologic Category Beta Blocker, Nonselective; Ophthalmic Agent, Antiglaucoma

Use: Labeled Indications To lower intraocular pressure in chronic open-angle glaucoma or ocular hypertension

Dosing: Adults Glaucoma: Ophthalmic: Instill 1 drop in the affected eye(s) 1-2 times/day

Dosing: Elderly Refer to adult dosing.

ContraindicationsHypersensitivity to levobunolol or any component of the formulation; bronchial asthma, severe COPD, sinus bradycardia, second- or third-degree AV block, cardiac failure, cardiogenic shock

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may worsen disease.
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

Special populations:

- Contact lens wearers: Some products contain benzalkonium chloride which may be absorbed by soft contact lenses; remove lens prior to administration and wait 15 minutes before reinserting.
- Elderly: Use with caution in the elderly with other disease states or syndromes that may be affected by a beta-blocker (CHF, COPD, etc); systemic absorption does occur with ophthalmic administration; monitor closely.
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Metabisulfite: Ophthalmic solutions contain metabisulfite.

Other warnings/precautions:

- Absorption: Systemic absorption and adverse effects may occur with ophthalmic use, including bradycardia and/or hypotension.

Geriatric ConsiderationsBecause systemic absorption does occur with ophthalmic administration, the elderly with other disease states or syndromes that may be affected by a beta-blocker (CHF, COPD, etc) should be monitored closely

Pregnancy Risk FactorC

Adverse Reactions

>10%: Ocular: Stinging/burning eyes

1% to 10%:

Cardiovascular: Bradycardia, arrhythmia, hypotension

Central nervous system: Dizziness, headache

Dermatologic: Alopecia, erythema

Local: Stinging, burning

Ocular: Blepharoconjunctivitis, conjunctivitis

Respiratory: Bronchospasm

<1%: Rash, itching, visual disturbances, keratitis, decreased visual acuity

Drug Interactions

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersIntraocular pressure, heart rate, funduscopic exam, visual field testing

Patient EducationMay sting on instillation; do not touch dropper to eye. Visual acuity may be decreased after administration. Night vision may be decreased. Distance vision may be altered. Apply finger pressure between the bridge of the nose and corner of the eye to decrease systemic absorption. Assess patient's or caregiver's ability to administer.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as hydrochloride: 0.25% (5 mL, 10 mL); 0.5% (5 mL, 10 mL, 15 mL) [contains benzalkonium chloride and sodium metabisulfite]

Betagan®: 0.25% (5 mL, 10 mL); 0.5% (2 mL, 5 mL, 10 mL, 15 mL) [contains benzalkonium chloride and sodium metabisulfite]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Betagan)

0.5% (10): $58.99

0.5% (15): $83.99

Solution (Levobunolol HCl)

0.25% (5): $14.99

Mechanism of ActionA nonselective beta-adrenergic blocking agent that lowers intraocular pressure by reducing aqueous humor production and possibly increases the outflow of aqueous humor

Pharmacodynamics/Kinetics

Onset of action: ~1 hour

Peak effect: 2-6 hours

Duration: 1-7 days

Excretion: Not well defined

Related Information

- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Levobunolol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay increase the effects of oral beta-blockers

Cardiovascular ConsiderationsIt is important to recognize that levobunolol eye drops may have systemic effects, particularly when patients are also on oral beta-blocker therapy or therapy with other negative chronotropic agents.

Index Terms*l*-Bunolol Hydrochloride; Levobunolol Hydrochloride

Levobupivacaine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration) among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(LEE voe byoo PIV a kane)

U.S. Brand NamesChirocaine® [DSC]

Canadian Brand NamesChirocaine®

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsProduction of local or regional anesthesia for surgery and obstetrics, and for postoperative pain management

Dosing: Adults**Note:** Rapid injection of a large volume of local anesthetic solution should be avoided. Fractional (incremental) doses are recommended.

Guidelines (individual response varies): See table.

	Concentration	**Volume**	**Dose**	**Motor Block**
Surgical Anesthesia				
Epidural for surgery	0.5%-0.75%	10-20 mL	50-150 mg	Moderate to complete
Epidural for C-section	0.5%	20-30 mL	100-150 mg	Moderate to complete
Peripheral nerve	0.25%-0.5%	0.4 mL/kg (30 mL)	1-2 mg/kg (75-150 mg)	Moderate to complete
Ophthalmic	0.75%	5-15 mL	37.5-112.5 mg	Moderate to complete
Local infiltration	0.25%	60 mL	150 mg	Not applicable
Pain Management				
Levobupivacaine can be used epidurally with fentanyl or clonidine; dilutions for epidural administration should be made with preservative free 0.9% saline according to standard hospital procedures for sterility				
Labor analgesia (epidural bolus)	0.25%	10-20 mL	25-50 mg	Minimal to moderate
Postoperative pain (epidural infusion)	0.125%[1]-0.25%	4-10 mL/h	5-25 mg/h	Minimal to moderate
[1] 0.125%: Adjunct therapy with fentanyl or clonidine.				

Maximum dosage: Epidural doses up to 375 mg have been administered incrementally to patients during a surgical procedure.

Intraoperative block and postoperative pain: 695 mg in 24 hours

Postoperative epidural infusion over 24 hours: 570 mg

Single-fractionated injection for brachial plexus block: 300 mg

Dosing: ElderlyRefer to adult dosing.

Administration: OtherIsopropyl or ethyl alcohol are recommended to disinfect the surface of the vial. Disinfectants containing heavy metals should not be used for mucous membrane disinfection since they have been related to incidents of swelling and edema. Prior to administration, it is essential that aspiration for blood or cerebrospinal fluid (where applicable) be performed prior to injecting any local anesthetic, both before the original dosage and at all subsequent doses (to avoid intravascular or intrathecal injection). A negative aspiration does not ensure against intrathecal or intravascular injection. Rapid injection of a large volume of local anesthetic solution should be avoided. Fractional (incremental) doses are recommended. Monitor patient during and after injection for symptoms of CNS or cardiac toxicity.

StorageStore at room temperature (20°C to 25°C/68°F to 77°F). Disinfectants containing heavy metals should not be used for mucous membrane disinfection since they have been related to incidents of swelling and edema. Isopropyl or ethyl alcohol is recommended. Stability of solution in vial has been demonstrated following an autoclave cycle at 121°C for 15 minutes.

CompatibilityStable in 0.9% sodium chloride injection USP, and with saline solutions containing morphine, fentanyl, and clonidine. Stable for 24 hours in PVC bags at room temperature when diluted to 0.625-2.5 mg levobupivacaine per mL; **incompatible** with alkaline pH solutions (pH >8.5).

ContraindicationsHypersensitivity to levobupivacaine, any component of the formulation, bupivacaine, or any local anesthetic of the amide type

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.
- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest, especially when administered near the head or neck.
- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection or administration near the head or neck.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with hypotension, hypovolemia, heart block, or cardiac impairment.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- Other local anesthetics: Use with caution in patients receiving other local anesthetics or structurally related agents.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- High concentration formulations: Use with caution when the higher concentration formulations are used; more likely to produce cardiac toxicity.
- Obstetrical anesthesia: The 0.75% is not recommended for obstetrical anesthesia.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided. Not for use in intravenous regional anesthesia (Bier block) or to produce obstetrical paracervical block anesthesia.
- Trained personnel: Clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorB

Pregnancy ConsiderationsLocal anesthetics rapidly cross the placenta and may cause varying degrees of maternal, fetal, and neonatal toxicity. Close maternal and fetal monitoring (heart rate and electronic fetal monitoring advised) are required during obstetrical use.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Hypotension (20% to 31%)

Central nervous system: Pain (postoperative) (7% to 18%), fever (7% to 17%)

Gastrointestinal: Nausea (12% to 21%), vomiting (8% to 14%)

Hematologic: Anemia (10% to 12%)

1% to 10%:

Cardiovascular: Abnormal ECG (3%), bradycardia (2%), tachycardia (2%), hypertension (1%)

Central nervous system: Pain (4% to 8%), headache (5% to 7%), dizziness (5% to 6%), hypoesthesia (3%), somnolence (1%), anxiety (1%), hypothermia (2%)

Dermatologic: Pruritus (4% to 9%), purpura (1%)

Endocrine & metabolic: Breast pain - female (1%)

Gastrointestinal: Constipation (3% to 7%), enlarged abdomen (3%), flatulence (2%), abdominal pain (2%), dyspepsia (2%), diarrhea (1%)

Genitourinary: Urinary incontinence (1%), urine flow decreased (1%), urinary tract infection (1%)

Hematologic: Leukocytosis (1%)

Local: Anesthesia (1%)

Neuromuscular & skeletal: Back pain (6%), rigors (3%), paresthesia (2%)

Ocular: Diplopia (3%)

Renal: Albuminuria (3%), hematuria (2%)

Respiratory: Cough (1%)

Miscellaneous: Fetal distress (5% to 10%), delayed delivery (6%), hemorrhage in pregnancy (2%), uterine abnormality (2%), increased wound drainage (1%)

<1%: Asthenia, edema, postural hypotension, hypokinesia, involuntary muscle contraction, generalized spasm, tremor, syncope, arrhythmia, extrasystoles, atrial fibrillation, cardiac arrest, ileus, elevated bilirubin, confusion, apnea, bronchospasm, dyspnea, pulmonary edema, respiratory insufficiency, diaphoresis increased, skin discoloration

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 3A4

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease levobupivacaine levels.

Monitoring ParametersMonitor the patient during and after injection for symptoms of CNS or cardiac toxicity

Nursing: Physical Assessment/MonitoringMonitor for effectiveness of anesthesia according to purpose for use. Monitor closely during and after injection for symptoms of CNS, cardiac toxicity, or hypotension. Monitor for return of sensation. Use appropriate patient safety measures until full return of sensation. Teach patient adverse symptoms to report.

Patient EducationThis medication is given to reduce sensation and pain. You will experience decreased sensation to pain, heat, or cold in the area and/or decreased muscle strength (depending on area of application). Until sensation returns, use caution to prevent injury (eg, avoid extremes of heat or cold to area, do not use sharp objects, avoid driving, climbing stairs, or sudden moves if muscle strength is affected). Immediately report chest pain or palpitations; increased restlessness, anxiety, dizziness or lightheadedness; sensation of sudden muscle weakness; swelling or tingling of mouth or lips; metallic taste; vision changes or hearing. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, solution [preservative free]: 2.5 mg/mL (10 mL, 30 mL); 5 mg/mL (10 mL, 30 mL); 7.5 mg/mL (10 mL, 30 mL) [DSC]

Generic AvailableNo

Mechanism of ActionLevobupivacaine is the S-enantiomer of bupivacaine. It blocks both the initiation and transmission of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction. Local anesthetics reversibly prevent generation and conduction of electrical impulses in neurons by decreasing the transient increase in permeability to sodium. The differential sensitivity generally depends on the size of the fiber; small fibers are more sensitive than larger fibers and require a longer period for recovery. Sensory pain fibers are usually blocked first, followed by fibers that transmit sensations of temperature, touch, and deep pressure. High concentrations block sympathetic somatic sensory and somatic motor fibers. The spread of anesthesia depends upon the distribution of the solution. This is primarily dependent on the site of administration and volume of drug injected.

Pharmacodynamics/Kinetics

Onset of action: Epidural: 10-14 minutes

Duration (dose dependent): 1-8 hours

Absorption: Dependent on route of administration and dose

Distribution: 67 L

Protein binding, plasma: >97%

Metabolism: Extensively hepatic via CYP3A4 and CYP1A2

Half-life elimination: 1.3 hours

Time to peak: Epidural: 30 minutes

Excretion: Urine (71%) and feces (24%) as metabolites

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness or somnolence; may rarely cause confusion

Mental Health: Effects on Psychiatric TreatmentFluvoxamine and nefazodone may increase the levels of levobupivacaine; carbamazepine and barbiturates may lower levels

Anesthesia and Critical Care Concerns/Other Considerations

Local anesthetic toxicity: Cardiac arrest: Lipid infusion has been used in animal studies and several human cases (Bupivacaine: Rosenblatt, 2006; Levobupivacaine: Foxall, 2007; Ropivacaine: Litz, 2006) where cardiovascular toxicity, unresponsive to conventional resuscitation, resulted. Additional information is available at http://www.lipidrescue.org. The protocol from the website is: **20% Fat Emulsion:** 1.5 mL/kg administered over 1 minute, followed immediately by an infusion of 0.25 mL/kg/minute. Continue chest compressions (lipid must circulate). Repeat bolus every 3-5 minutes up to 3 mL/kg total dose until circulation restored. Continue infusion until hemodynamic stability is restored. Increase the infusion rate to 0.5 mL/kg/minute if BP declines. A maximum total dose of 8 mL/kg is recommended.

Medication Safety Issues

Sound-alike/look-alike issues:

Levocabastine may be confused with levobunolol, levocarnitine

Livostin® may be confused with lovastatin

International issues:

Livostin® may be confused with Limoxin® which is a brand name for amoxicillin in Mexico

Livostin® may be confused with Lovastin® which is a brand name for lovastatin in Malaysia and Poland

Pronunciation(LEE voe kab as teen)
U.S. Brand NamesLivostin® [DSC]
Canadian Brand NamesLivostin®
Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation
Use: Labeled IndicationsTreatment of allergic conjunctivitis
Dosing: AdultsAllergic conjunctivitis: Ophthalmic: Instill 1 drop in affected eye(s) 4 times/day for up to 2 weeks
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥12 years: Refer to adult dosing.
ContraindicationsHypersensitivity to levocabastine any component of product; use while soft contact lenses are being worn
Warnings/Precautions

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.
- Soft contact lens wearers: Do not use while wearing soft contact lenses.

Other warnings/precautions:

- Appropriate use: For topical ophthalmic use only; avoid touching the dropper tip to surfaces to avoid contamination.

Pregnancy Risk FactorC
Adverse Reactions

>10%: Local: Transient burning, stinging, discomfort

1% to 10%:

Central nervous system: Headache, somnolence, fatigue

Dermatologic: Rash

Gastrointestinal: Xerostomia

Ocular: Blurred vision, eye pain, somnolence, red eyes, eyelid edema

Respiratory: Dyspnea

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects. Teach patient proper use, side effects/appropriate interventions, and symptoms to report.

Patient EducationFor use in eyes only. Shake well before using. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Do not wear contact lenses during treatment. This medication may cause drowsiness in some patients. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension, ophthalmic: 0.05% (5 mL, 10 mL) [contains benzalkonium chloride] [DSC]

Sound-alike/look-alike issues:

Levocarnitine may be confused with levocabastine

Pronunciation(lee voe KAR ni teen)

U.S. Brand Names Carnitor®; Carnitor® SF

Canadian Brand Names Carnitor®

Pharmacologic Category Dietary Supplement

Use: Labeled Indications

Oral: Primary systemic carnitine deficiency; acute and chronic treatment of patients with an inborn error of metabolism which results in secondary carnitine deficiency

I.V.: Acute and chronic treatment of patients with an inborn error of metabolism which results in secondary carnitine deficiency; prevention and treatment of carnitine deficiency in patients with end-stage renal disease (ESRD) who are undergoing hemodialysis.

Dosing: Adults

Carnitine deficiency:

Oral: 990 mg (tablet) 2-3 times/day or 1-3 g/day (solution)

I.V.: 50 mg/kg/day in divided doses; titrate based on patient response. Maximum reported dose: 300 mg/kg. An equivalent loading dose may be used in patients in severe metabolic crisis.

ESRD patients on hemodialysis: I.V.: 20 mg/kg dry body weight as a slow 2- to 3-minute bolus after each dialysis session

Note: Safety and efficacy of oral carnitine have not been established in ESRD. Chronic administration of high **oral** doses to patients with severely compromised renal function or ESRD patients on dialysis may result in accumulation of **potentially toxic** metabolites.

Dosing: Elderly Refer to adult dosing.

Dosing: Pediatric

Carnitine deficiency:

Oral: Infants and Children: Initial: 50 mg/kg/day; titrate to 50-100 mg/kg/day in divided doses with a maximum dose of 3 g/day

I.V.: Refer to adult dosing.

Administration: I.V.

Hemodialysis patients: Injection should be given over 2-3 minutes into the venous return line after each dialysis session.

Carnitine deficiency: Administer as a bolus dose over 2-3 minutes or by infusion. Doses should be administered every 3-6 hours.

Administration: Oral Solution may be dissolved in either drink or liquid food. The oral solution should be consumed slowly and spaced evenly throughout the day to improve tolerance. Doses should be spaced every 3-4 hours throughout the day, preferably during or following meals.

StorageIntravenous solution: Store at 25°C (77°F). Compatible at concentrations between 0.5-8 mg/mL in 0.9% sodium chloride or lactated Ringer's solution. Stable in PVC bags for 24 hours.

Warnings/Precautions

Disease-related concerns:

- Renal impairment: Safety and efficacy of oral carnitine have not been established in ESRD. Chronic administration of high oral doses to patients with severely compromised renal function or ESRD patients on dialysis may result in accumulation of potentially toxic metabolites.
- Seizure disorder: Use with caution in patients with seizure disorders or in those at risk of seizures (CNS mass or medications which may lower seizure threshold; both new-onset seizure activity as well as an increased frequency of seizures has been observed.

Pregnancy Risk FactorB

Pregnancy Considerations Teratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. However, carnitine is a naturally occurring substance in mammalian metabolism.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIn breast-feeding women, use must be weighed against the potential exposure of the infant to increased carnitine intake.

Adverse ReactionsFrequencies noted with I.V. therapy (hemodialysis patients).

>10%:

- Cardiovascular: Hypertension (18% to 21%), chest pain (6% to 15%)
- Central nervous system: Headache (3% to 37%), dizziness (10% to 18%), fever (5% to 12%)
- Endocrine & metabolic: Hypercalcemia (6% to 15%)
- Gastrointestinal: Diarrhea (9% to 35%), vomiting (9% to 21%), abdominal pain (5% to 21%), nausea (9% to 12%)
- Hematologic: Anemia (3% to 12%)
- Neuromuscular & skeletal: Weakness (8% to 12%), paresthesia (3% to 12%)
- Respiratory: Cough (10% to 18%), rhinitis (6% to 11%)
- Miscellaneous: Infection (10% to 24%)

1% to 10%:

- Cardiovascular: Tachycardia (5% to 9%), hemorrhage (2% to 9%), palpitation (3% to 8%), peripheral edema (3% to 6%), atrial fibrillation (2% to 6%), ECG abnormality (2% to 6%), vascular disorder (2% to 6%)
- Central nervous system: Depression (5% to 6%), vertigo (2% to 6%)
- Dermatologic: Rash (3% to 5%)
- Endocrine & metabolic: Parathyroid disorder (2% to 6%)
- Gastrointestinal: Taste perversion (2% to 9%), weight loss (3% to 8%), anorexia (3% to 6%), gastrointestinal disorder (2% to 6%), melena (2% to 6%), weight gain (2% to 6%)
- Ocular: Amblyopia (3% to 6%), eye disorder (3% to 6%)
- Respiratory: Bronchitis (3% to 5%)
- Miscellaneous: Allergic reaction (2% to 6%)

Frequency not defined: Body odor, gastritis, seizure

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersPlasma concentrations should be obtained prior to beginning parenteral therapy, and should be monitored weekly to monthly. In metabolic disorders: monitor blood chemistry, vital signs, and plasma carnitine levels (maintain between 35-60 µmol/L). In ESRD patients on dialysis: National Kidney Foundation guidelines recommend basing treatment on clinical signs and symptoms; evaluate response at 3-month intervals and discontinue if no clinical improvement noted within 9-12 months. Reimbursement may require documentation of a plasma free carnitine level <40 µmol/L.

Reference RangeNormal carnitine levels are 40-50 µmol/L; levels should be maintained on therapy between 35-60 µmol/L

Nursing: Physical Assessment/MonitoringMonitor therapeutic effectiveness (according to rationale for therapy) and adverse reactions (eg, CNS, hypertension). **Oral:** Monitor therapeutic effectiveness and assess severity. Assess knowledge and teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.

Monitoring: Lab TestsPlasma concentrations should be obtained prior to beginning parenteral therapy, and should be monitored weekly to monthly. In metabolic disorders: monitor blood chemistry and plasma carnitine levels (maintain between 35-60 µmol/L). In ESRD patients on dialysis: National Kidney Foundation guidelines recommend basing treatment on clinical signs and symptoms; evaluate response at 3-month intervals and discontinue if no clinical improvement noted within 9-12 months. Reimbursement may require documentation of a plasma free carnitine level <40 µmol/L.

Patient EducationI.V.: Report immediately any dizziness, loss of feeling, acute headache, tremors, or nausea.

Oral: Take exactly as directed; do not alter dose or frequency except as directed by prescriber. Dissolve solution in any liquid and drink with or following meals. The oral solution should be consumed slowly and spaced evenly throughout the day to improve tolerance. You may experience abdominal pain, nausea, or vomiting (small frequent meals, chewing gum, or sucking hard candy); diarrhea (yogurt, boiled milk, or buttermilk may help); or dizziness (use caution driving or engaging in hazardous activities until response to drug is known). Report acute headache, chest pain, tremors, or visual changes; muscle or skeletal weakness; skin rash; swelling of extremities; or other adverse effects. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution (Levocarnitine)

1 g/10 mL (118): $29.98

Tablets (Carnitor)

330 mg (90): $84.99

Tablets (Levocarnitine)

330 mg (90): $69.99

Mechanism of ActionCarnitine is a naturally occurring metabolic compound which functions as a carrier molecule for long-chain fatty acids within the mitochondria, facilitating energy production. Carnitine deficiency is associated with accumulation of excess acyl CoA esters and disruption of intermediary metabolism. Carnitine supplementation increases carnitine plasma concentrations. The effects on specific metabolic alterations have not been evaluated. ESRD patients on maintenance HD may have low plasma carnitine levels because of reduced intake of meat and dairy products, reduced renal synthesis, and dialytic losses. Certain clinical conditions (malaise, muscle weakness, cardiomyopathy and arrhythmias) in HD patients may be related to carnitine deficiency.

Pharmacodynamics/Kinetics

Metabolism: Hepatic (limited with moderate renal impairment), to trimethylamine (TMA) and trimethylamine N-oxide (TMAO)

Bioavailability: Oral: ~10% to 20%

Half-life elimination: 17.4 hours

Time to peak: Oral: 3.3 hours

Excretion: Urine (76%, 4% to 9% as unchanged drug); feces (<1%)

Pharmacotherapy PearlsAlthough supplemental carnitine has been shown to increase carnitine concentrations, effects on the signs and symptoms of carnitine deficiency have not been determined.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Levocetirizine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Levocetirizine may be confused with cetirizine

Pronunciation(LEE vo se TI ra zeen)

U.S. Brand NamesXyzal®

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation

Use: Labeled IndicationsRelief of symptoms of perennial and seasonal allergic rhinitis; treatment of skin manifestations (uncomplicated) of chronic idiopathic urticaria

Dosing: AdultsAllergic rhinitis, chronic urticaria: Oral: 5 mg once daily (in the evening); some patients may experience relief of symptoms with 2.5 mg once daily

Dosing: ElderlyRefer to adult dosing; dosing should begin at the lower end of the dosing range.

Dosing: PediatricAllergic rhinitis, chronic urticaria: Children: Oral:

6-11 years: 2.5 mg once daily (in the evening); maximum: 2.5 mg/day

≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Children 6-11 years with renal impairment: Contraindicated

Children ≥12 and Adults:

Cl_{cr} 50-80 mL/minute: 2.5 mg once daily

Cl_{cr} 30-50 mL/minute: 2.5 mg once every other day

Cl_{cr} 10-30 mL/minute: 2.5 mg twice weekly (every 3 or 4 days)

Cl_{cr} <10 mL/minute, hemodialysis patients: Contraindicated

Dosing: Hepatic ImpairmentNo adjustment required.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister in the evening. May be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to levocetirizine, cetirizine, or any component of the formulation; end-stage renal disease; hemodialysis; children 6-11 years of age with renal impairment

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Renal impairment: Levocetirizine is excreted primarily by the kidneys; use with caution in adults with mild-to-moderate renal impairment; dosage adjustments may be needed. Use is contraindicated in end-stage renal disease (Cl_{cr} <10 mL/minute), patients undergoing hemodialysis, and in children 6-11 years of age with renal impairment.

Special populations:

- Elderly: Use with caution in the elderly.
- Pediatrics: Not FDA approved for use in children <6 years of age.

Geriatric ConsiderationsSee Dosage - Renal Impairment.

Pregnancy Risk FactorB

Pregnancy ConsiderationsLevocetirizine was not shown to be teratogenic in animal studies. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsCetirizine is excreted in breast milk; therefore, levocetirizine would be expected to enter breast milk. Use is not recommended while breast-feeding.

Adverse Reactions

1% to 10%:

Central nervous system: Somnolence (3% to 6%), fever (children 4%), fatigue (1% to 4%)

Gastrointestinal: Xerostomia (2% to 3%)

Neuromuscular & skeletal: Weakness (2%)

Respiratory: Nasopharyngitis (4% to 6%), cough (children 3%), epistaxis (children 2%), pharyngitis (1% to 2%)

<1%, postmarketing, and/or case reports: Aggression, agitation, anaphylaxis, angioneurotic edema, bilirubin increased, dyspnea, fixed-drug eruption, hepatitis, hypersensitivity, myalgia, nausea, palpitation, pruritus, rash, seizure, syncope, transaminases increased, urticaria, visual disturbances, weight gain

The following potentially-severe adverse reactions have been reported with cetirizine and, therefore, may also occur with levocetirizine: Cholestasis, glomuleronephritis, hallucination, hypotension (severe), orofacial dyskinesia, suicidal ideation

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersCreatinine clearance (prior to treatment for dosing adjustment)

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsCreatinine clearance (prior to treatment for dosing adjustment)

Patient EducationYou may experience drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Avoid alcohol or use of other central nervous system depressants; may increase drowsiness. Maintain adequate hydration (2-3 L/day) unless instructed to restrict intake by prescriber. Report excessive sedation. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral, as dihydrochloride:

Xyzal®: 0.5 mg/mL (150 mL)

Tablet, as dihydrochloride [scored]:

Xyzal®: 5 mg

Generic AvailableNo

ManufacturerUCB, Inc and Sanofi-Aventis

Pricing: U.S. (www.drugstore.com)

Solution (Xyzal)

2.5 mg/5 mL (148): $89.23

Tablets (Xyzal)

5 mg (90): $261.41

Mechanism of ActionLevocetirizine is an antihistamine which selectively competes with histamine for H_1-receptor sites on effector cells in the gastrointestinal tract, blood vessels, and respiratory tract. Levocetirizine, the active enantiomer of cetirizine, has twice the binding affinity at the H1-receptor compared to cetirizine.

Pharmacodynamics/Kinetics

Onset of action: 1 hour

Duration: 24 hours

Absorption: Rapid and extensive

Distribution: 0.4 L/kg

Protein binding: 91% to 92%

Metabolism: Minimal (<14%); via aromatic oxidation, N and O-dealkylation (via CYPA4), and taurine conjugation

Half-life elimination: Children: ~6 hours; Adults: ~8-9 hours; Renal impairment: 11-34 hours; End-stage renal disease: 46 hours

Time to peak, plasma: Children: 1.2 hours; Adults: Oral solution: 0.5 hours, Tablet: 0.9 hours

Excretion: Urine (85%); feces (13%)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause CNS depression; use with caution. Rare reports of aggression and agitation.

Mental Health: Effects on Psychiatric Treatment Acetylcholinesterase inhibitors may diminish the therapeutic effect of levocetirizine. Conversely, levocetirizine may diminish the therapeutic effect of centrally-acting acetylcholinesterase inhibitors. May cause anticholinergic and sedative adverse effects; concomitant use with psychotropics with anticholinergic or sedative activity may produce additive effects. Antihistamines may enhance the arrhythmogenic effect of phenothiazine antipsychotic agents.

Index Terms Levocetirizine Dihydrochloride

Levodopa, Carbidopa, and Entacapone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(lee voe DOE pa, kar bi DOE pa, & en TA ka pone)
U.S. Brand NamesStalevo®
Canadian Brand NamesStalevo®
Pharmacologic CategoryAnti-Parkinson's Agent, COMT Inhibitor; Anti-Parkinson's Agent, Dopamine Agonist
Use: Labeled IndicationsTreatment of idiopathic Parkinson's disease
Dosing: Adults

Note: All strengths of Stalevo® contain a carbidopa/levodopa ratio of 1:4 plus entacapone 200 mg.

Parkinson's disease: Oral: Dose should be individualized based on therapeutic response; doses may be adjusted by changing strength or adjusting interval. Fractionated doses are not recommended and only 1 tablet should be given at each dosing interval; maximum daily dose: 8 tablets of Stalevo® 50, 75, 100, 125, or 150, **or** 6 tablets of Stalevo® 200.

Patients previously treated with carbidopa/levodopa immediate release tablets (ratio of 1:4):

With current entacapone therapy: May switch directly to corresponding strength of combination tablet. No data available on transferring patients from controlled release preparations or products with a 1:10 ratio of carbidopa/levodopa.

Without entacapone therapy:

If current levodopa dose is >600 mg/day: Levodopa dose reduction may be required when adding entacapone to therapy; therefore, titrate dose using individual products first (carbidopa/levodopa immediate release with a ratio of 1:4 plus entacapone 200 mg); then transfer to combination product once stabilized.

If current levodopa dose is <600 mg without dyskinesias: May transfer to corresponding dose of combination product; monitor, dose reduction of levodopa may be required.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentUse caution with severe renal impairment; specific dosing recommendations not available.
Dosing: Hepatic ImpairmentUse with caution; specific dosing recommendations not available.
Administration: OralSwallow tablet whole; do not crush, break, or chew. Only 1 tablet should be administered at each dosing interval.
Dietary ConsiderationsMay take with or without food. Distribute protein intake throughout the day to avoid fluctuations in levodopa absorption. Separate dosing of iron supplements and multivitamins with minerals.
StorageStore at controlled room temperature of 25°C (77°F).
ContraindicationsHypersensitivity to levodopa, carbidopa, entacapone, or any component of the formulation; use of nonselective MAO inhibitor therapy with or within prior 14 days; narrow-angle glaucoma; undiagnosed skin lesions or history of melanoma
Allergy Considerations

- COMT Inhibitor Allergy
- Levodopa Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Dyskinesias: May cause or exacerbate dyskinesias; may require dose adjustment.

• Hallucinations: May cause hallucinations.

• Impulsive control disorders: Dopamine agonists used for Parkinson’s disease or restless legs syndrome have been associated with compulsive behaviors and/or loss of impulse control, which has manifested as pathological gambling, libido increases (hypersexuality), and/or binge eating. Causality has not been established, and controversy exists as to whether this phenomenon is related to the underlying disease, prior behaviors/addictions and/or drug therapy. Dose reduction or discontinuation of therapy has been reported to reverse these behaviors in some, but not all cases.

• Pleural/retroperitoneal fibrosis: Ergot-derived dopamine agonists have also been associated with fibrotic complications (eg, retroperitoneal fibrosis, pleural effusions, pleural thickening, and pulmonary infiltrates); monitor closely for signs and symptoms of fibrosis.

• Rhabdomyolysis: Severe cases have been reported; may be related to severe, prolonged motor activity/dyskinesia.

• Syncope: May cause syncope; incidence may be increased in patients with documented hypotension.

Disease-related concerns:

• Cardiovascular disease: Use with caution in patients with cardiovascular disease, including a history of myocardial infarction and arrhythmias.

- Endocrine disease: Use with caution when interpreting plasma/urine catecholamine levels; falsely diagnosed pheochromocytoma has been rarely reported.

- Glaucoma: Use with caution in patients with wide-angle glaucoma; monitor IOP carefully; contraindicated in patients with narrow-angle glaucoma.

- Hepatic impairment: Use with caution in patients with hepatic impairment, including biliary obstruction.

- Peptic ulcer disease: Use with caution in patients with a history of peptic ulcer disease; risk of gastrointestinal hemorrhage may be increased.

- Psychotic disorders: Use with extreme caution in patients with psychotic disorders; observe patients closely for development of depression with concomitant suicidal tendencies.

- Renal impairment: Use with caution in patients with severe renal impairment.

Concurrent drug therapy concerns:

- Catecholamines: Use caution with agents metabolized by COMT (eg, epinephrine, dopamine, methyldopa) regardless of route of administration; effects may be enhanced when used with entacapone.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Discontinuation of therapy: Dopaminergic agents have been associated with a syndrome resembling neuroleptic malignant syndrome on abrupt withdrawal or significant dosage reduction after long-term use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were observed with levodopa, carbidopa, and entacapone in animal studies. There are case reports of levodopa crossing the placenta in humans. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if potential benefit exceeds risks.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsSee individual agents.

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

COMT Substrates: COMT Inhibitors may decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Levodopa. Only applies to oral iron preparations. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

MAO Inhibitors: Levodopa may enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

MAO Inhibitors: COMT Inhibitors may enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Methionine: May diminish the therapeutic effect of Levodopa. Probably only with large doses of methionine. Data was generated using 4.5gm daily. *Risk D: Consider therapy modification*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Phenytoin: May diminish the therapeutic effect of Levodopa. *Risk C: Monitor therapy*

Pyridoxine: May diminish the therapeutic effect of Levodopa. *Risk D: Consider therapy modification*

Sapropterin: May enhance the adverse/toxic effect of Levodopa. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: High-protein diets and increased stomach acid may delay absorption of levodopa. Iron may decrease bioavailability of levodopa. Entacapone has been reported to chelate iron and decreasing serum iron levels were noted in clinical trials; however, clinically significant anemia has not been observed.

Test InteractionsFalse-negative reaction using glucose-oxidase tests for glucosuria; false-positive urine ketones; false diagnosis for pheochromocytoma (rare) based on plasma and urine levels of catecholamines

Monitoring ParametersSigns and symptoms of Parkinson's disease; liver function tests, renal function; blood pressure, mental status; signs and symptoms of neuroleptic malignant syndrome if abrupt discontinuation required (as with surgery); serum iron (if signs of anemia); IOP (in patients with wide-angle glaucoma)

Nursing: Physical Assessment/MonitoringSee individual agents (Carbidopa and Levodopa; Entacapone).

Monitoring: Lab TestsLiver function tests, serum iron (if signs of anemia)

Patient EducationSee individual agents (Carbidopa and Levodopa; Entacapone). Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant or intend to become pregnant or are breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Stalevo® 50: Levodopa 50 mg, carbidopa 12.5 mg, and entacapone 200 mg

Stalevo® 75: Levodopa 75 mg, carbidopa 18.75 mg, and entacapone 200 mg

Stalevo® 100: Levodopa 100 mg, carbidopa 25 mg, and entacapone 200 mg

Stelevo® 125: Levodopa 125 mg, carbidopa 31.25 mg, and entacapone 200 mg

Stalevo® 150: Levodopa 150 mg, carbidopa 37.5 mg, and entacapone 200 mg

Stalevo® 200: Levodopa 200 mg, carbidopa 50 mg, and entacapone 200 mg

Tablets (Stalevo 50)

12.5-50-200 mg (30): $90.31

Mechanism of Action

Levodopa: The metabolic precursor of dopamine, a chemical depleted in Parkinson's disease. Levodopa is able to circulate in the plasma and cross the blood-brain-barrier (BBB), where it is converted by striatal enzymes to dopamine.

Carbidopa: Inhibits the peripheral plasma breakdown of levodopa by inhibiting its decarboxylation; increases available levodopa at the BBB

Entacapone: A reversible and selective inhibitor of catechol-O-methyltransferase (COMT). Alters the pharmacokinetics of levodopa, resulting in more sustained levodopa serum levels and increased concentrations available for absorption across the BBB.

Pharmacodynamics/KineticsSee individual agents.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Levaquin® may be confused with Levoxyl®, Levsin/SL®, Lovenox®

Levofloxacin may be confused with levetiracetam, levodopa, levothyroxine

Pronunciation(lee voe FLOKS a sin)

U.S. Brand NamesIquix®; Levaquin®; Quixin®

Canadian Brand NamesLevaquin®; Novo-Levofloxacin

Pharmacologic CategoryAntibiotic, Quinolone; Respiratory Fluoroquinolone

Use: Labeled Indications

Systemic: Treatment of community-acquired pneumonia, including multidrug resistant strains of *S. pneumoniae* (MDRSP); nosocomial pneumonia; chronic bronchitis (acute bacterial exacerbation); acute bacterial sinusitis; prostatitis, urinary tract infection (uncomplicated or complicated); acute pyelonephritis; skin or skin structure infections (uncomplicated or complicated); reduce incidence or disease progression of inhalational anthrax (postexposure)

Ophthalmic: Treatment of bacterial conjunctivitis caused by susceptible organisms (Quixin™ 0.5% ophthalmic solution); treatment of corneal ulcer caused by susceptible organisms (Iquix® 1.5% ophthalmic solution)

Use: Unlabeled/InvestigationalDiverticulitis, enterocolitis (*Shigella* spp.), epididymitis (nongonococcal), gonococcal infections, Legionnaires' disease, peritonitis, PID

Note: As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of gonococcal disease.

Dosing: Adults**Note:** Sequential therapy (intravenous to oral) may be instituted based on prescriber's discretion.

Anthrax (inhalational): 500 mg every 24 hours for 60 days, beginning as soon as possible after exposure

Chronic bronchitis (acute bacterial exacerbation): Oral, I.V.: 500 mg every 24 hours for at least 7 days

Conjunctivitis (0.5% ophthalmic solution): Ophthalmic:

Treatment day 1 and day 2: Instill 1-2 drops into affected eye(s) every 2 hours while awake, up to 8 times/day

Treatment day 3 through day 7: Instill 1-2 drops into affected eye(s) every 4 hours while awake, up to 4 times/day

Corneal ulceration (1.5% ophthalmic solution): Ophthalmic:

Treatment day 1 through day 3: Instill 1-2 drops into affected eye(s) every 30 minutes to 2 hours while awake and 4-6 hours after retiring.

Treatment day 4 through completion: Instill 1-2 drops into affected eye(s) every 1 to 4 hours while awake.

Diverticulitis, peritonitis (unlabeled use): Oral, I.V.: 750 mg every 24 hours for 7-10 days; use adjunctive metronidazole therapy

Dysenteric enterocolitis,*Shigella spp.*(unlabeled use): Oral, I.V.: 500 mg every 24 hours for 3-5 days

Epididymitis, nongonococcal (unlabeled use): 500 mg once daily for 10 days

Gonococcal infection (unlabeled use): Oral, I.V.:

Cervicitis, urethritis: 250 mg for one dose with azithromycin or doxycycline; **Note:** As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of uncomplicated gonococcal disease.

Disseminated infection: 250 mg I.V. once daily; 24 hours after symptoms improve may change to 500 mg orally every 24 hours to complete total therapy of 7 days; **Note:** As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of more serious gonococcal disease, unless no other options exist and susceptibility can be confirmed via culture.

Pelvic inflammatory disease (unlabeled use): 500 mg once daily for 14 days with or without adjunctive metronidazole; **Note:** The CDC recommends use only if standard cephalosporin therapy is not feasible and community prevalence of quinolone-resistant gonococcal organisms is low. Culture sensitivity must be confirmed.

Pneumonia: Oral, I.V.:

Community-acquired: 500 mg every 24 hours for 7-14 days or 750 mg every 24 hours for 5 days (efficacy of 5-day regimen for MDRSP not established)

Nosocomial: 750 mg every 24 hours for 7-14 days

Prostatitis (chronic bacterial): Oral, I.V.: 500 mg every 24 hours for 28 days

Sinusitis (acute bacterial): Oral, I.V.: 500 mg every 24 hours for 10-14 days or 750 mg every 24 hours for 5 days

Skin and skin structure infections: Oral, I.V.:

Uncomplicated: 500 mg every 24 hours for 7-10 days

Complicated: 750 mg every 24 hours for 7-14 days

Traveler's diarrhea (unlabeled use): Oral, I.V.: 500 mg for one dose

Urinary tract infections: Oral, I.V.:

Uncomplicated: 250 mg once daily for 3 days

Complicated, including acute pyelonephritis: 250 mg once daily for 10 days **or** 750 mg once daily for 5 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Anthrax (inhalational, postexposure): : Oral, I.V.

Children ≥6 months and ≤50 kg: 8 mg/kg every 12 hours for 60 days (do not exceed 250 mg/dose), beginning as soon as possible after exposure

>50 kg : 500 mg every 24 hours for 60 days, beginning as soon as possible after exposure

Conjunctivitis (bacterial): Ophthalmic: Children ≥1 year: Refer to adult dosing.

Corneal ulceration: Ophthalmic: Children ≥6 years: Refer to adult dosing.

Dosing: Renal Impairment

Normal renal function dosing of 750 mg/day:

Cl_{cr} 20-49 mL/minute: Administer 750 mg every 48 hours

Cl_{cr} 10-19 mL/minute: Administer 750 mg initial dose, followed by 500 mg every 48 hours

Hemodialysis/CAPD: Administer 750 mg initial dose, followed by 500 mg every 48 hours

Normal renal function dosing of 500 mg/day:

Cl_{cr} 20-49 mL/minute: Administer 500 mg initial dose, followed by 250 mg every 24 hours

Cl_{cr} 10-19 mL/minute: Administer 500 mg initial dose, followed by 250 mg every 48 hours

Hemodialysis/CAPD: Administer 500 mg initial dose, followed by 250 mg every 48 hours

Normal renal function dosing of 250 mg/day:

Cl_{cr} 20-49 mL/minute: No dosage adjustment required

Cl_{cr} 10-19 mL/minute: Administer 250 mg every 48 hours (except in uncomplicated UTI, where no dosage adjustment is required)

Hemodialysis/CAPD: No information available

CRRT: **Note:** Clearance dependent on filter type, flow rates, and other variables.

CVVH/CVVHD/CVVHDF: Alternative recommendations exist:

500 mg every 48 hours **or**

250 mg every 24 hours (**Note:** This regimen has been shown to be equivalent to 500 mg/day in normal renal function. Appropriateness of this regimen for target dosing equal to 750 mg/day is not known.)

Calculations

- Creatinine Clearance: Adults

Administration: I.V.Infuse 250-500 mg I.V. solution over 60 minutes; infuse 750 mg I.V. solution over 90 minutes. Too rapid of infusion can lead to hypotension. Avoid administration through an intravenous line with a solution containing multivalent cations (eg, magnesium, calcium). Maintain adequate hydration of patient to prevent crystalluria.

Administration: I.V. DetailpH: 3.8-5.8

Administration: OralTablets may be administered without regard to meals. Oral solution should be administered 1 hour before or 2 hours after meals. Maintain adequate hydration of patient to prevent crystalluria.

Dietary ConsiderationsTablets may be taken without regard to meals. Oral solution should be administered on an empty stomach (1 hour before or 2 hours after a meal). Take 2 hours before or 2 hours after multiple vitamins, antacids, or other products containing magnesium, aluminum, iron, or zinc.

Storage

Solution for injection:

Vial: Store at room temperature. Protect from light. Diluted solution is stable for 72 hours when stored at room temperature; stable for 14 days when stored under refrigeration. When frozen, stable for 6 months; do not refreeze. Do not thaw in microwave or by bath immersion.

Premixed: Store at ≤25°C (77°F); do not freeze. Brief exposure to 40°C (104°F) does not affect product. Protect from light.

Tablet, oral solution: Store at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

Ophthalmic solution: Store at 15°C to 25°C (59°F to 77°F).

ReconstitutionSolution for injection: Single-use vials must be further diluted in compatible solution to a final concentration of 5 mg/mL prior to infusion.

CompatibilityStable in D_5LR, D_5NS, $D_5{}^1/_2$NS with 0.15% KCl, D_5W, NS, Plasma-Lyte® 56/5% dextrose, sodium lactate (M/6); **incompatible** with mannitol 20%, sodium bicarbonate 5%.

Y-site administration: Compatible: Amikacin, aminophylline, ampicillin, bivalirudin, caffeine citrate, cefotaxime, cimetidine, clindamycin, daptomycin, dexamethasone sodium phosphate, dobutamine, dopamine, epinephrine, fenoldopam, fentanyl, gentamicin, isoproterenol, lidocaine, linezolid, lorazepam, metoclopramide, morphine, oxacillin, pancuronium, penicillin G sodium, phenobarbital, phenylephrine, sodium bicarbonate, vancomycin. **Incompatible:** Acyclovir, alprostadil, azithromycin, drotrecogin alfa, furosemide, heparin, indomethacin, lansoprazole, nitroglycerin, propofol, sodium nitroprusside. **Variable (consult detailed reference):** Insulin (regular).

RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to levofloxacin, any component of the formulation, or other quinolones

Allergy Considerations

- Fluoroquinolone Allergy

Warnings/Precautions

Boxed Warnings:

- Tendon inflammation/rupture: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Altered cardiac conduction: Fluoroquinolones may prolong QT_c interval; avoid use in patients with a history of QT_c prolongation, uncorrected hypokalemia, hypomagnesemia, or concurrent administration of other medications known to prolong the QT interval (including Class Ia and Class III antiarrhythmics, cisapride, erythromycin, antipsychotics, and tricyclic antidepressants).

- CNS stimulation: Tremor, restlessness, confusion, and very rarely hallucinations or seizures may occur; use with caution in patients with known or suspected CNS disorder. Discontinue in patients who experience significant CNS adverse effects (eg, dizziness, hallucinations, suicidal ideations or actions).

- Glucose regulation: Fluoroquinolones have been associated with the development of serious, and sometimes fatal, hypoglycemia. These events have occurred most often in elderly patients with diabetes, but have also been reported in patients without a prior history of diabetes. Prompt identification and treatment of hypoglycemia is essential. Individual quinolones may differ in their potential to cause this effect. It was most evident with gatifloxacin (no longer marketed as systemic formulation). Hyperglycemia has also been associated with the use of fluoroquinolones. Patients should be monitored closely for signs/symptoms of disordered glucose regulation.

- Hepatotoxicity: Unrelated to hypersensitivity, severe hepatotoxicity (including acute hepatitis and fatalities) has been reported. Elderly patients may be at greater risk. Discontinue therapy immediately if signs and symptoms of hepatitis occur.

- Hypersensitivity reactions: Severe hypersensitivity reactions, including anaphylaxis, have occurred with quinolone therapy. The spectrum of these reactions can vary widely; reactions may present as typical allergic symptoms (eg, itching, urticaria, rash, edema) after a single dose, or may manifest as severe idiosyncratic dermatologic (eg, Stevens-Johnson, toxic epidermal necrolysis), vascular (eg, vasculitis), pulmonary (eg, pneumonitis), renal (eg, nephritis), hepatic (eg, hepatic failure or necrosis), and/or hematologic (eg, anemia, cytopenias) events, usually after multiple doses. Prompt discontinuation of drug should occur if skin rash or other symptoms arise.

- Peripheral neuropathy: The use of quinolones has been linked to peripheral neuropathy (rare); discontinue if symptoms of sensory or sensorimotor neuropathy occur.

- Phototoxicity: Avoid excessive sunlight and take precautions to limit exposure (eg, loose fitting clothing, sunscreen); may cause moderate-to-severe phototoxicity reactions. Discontinue use if photosensitivity occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

- Tendon inflammation/rupture: **[U.S. Boxed Warning]: There have been reports of tendon inflammation and/or rupture with quinolone antibiotics; risk may be increased with concurrent corticosteroids, organ transplant recipients, and in patients >60 years of age.** Rupture of the Achilles tendon sometimes requiring surgical repair has been reported most frequently; but other tendon sites (eg, rotator cuff, biceps) have also been reported. Strenuous physical activity may be an independent risk factor for tendonitis. Discontinue at first sign of tendon inflammation or pain. May occur even after discontinuation of therapy.

Disease-related concerns:

- Myasthenia gravis: Some quinolones may exacerbate myasthenia gravis, use with caution (rare, potentially life-threatening weakness of respiratory muscles may occur).

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required. May increase risk of tendon rupture.

- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may increase risk of tendon rupture.

- Seizures: Use with caution in individuals at risk of seizures (CNS disorders or concurrent therapy with medications which may lower seizure threshold). Potential for seizures, although very rare, may be increased with concomitant NSAID therapy.

Special populations:

- Elderly: Adverse effects (eg, hepatotoxicity, tendon rupture, QT changes) may be increased in the elderly.

- G6PD deficiency: Hemolytic reactions may (rarely) occur with quinolone use in patients with latent or actual G6PD deficiency.

- Pediatrics: Safety and efficacy have not been established in children <1 year of age for Quixin™ and in children <6 years of age for Iquix®. Systemic use is only recommended in children <18 years of age for the prevention of inhalational anthrax (postexposure); increased incidence of musculoskeletal disorders (eg, arthralgia, tendon rupture) has been observed in children.

Dosage form specific issues:

- Ophthalmic solution: For topical use only. Do not inject subconjunctivally or introduce into anterior chamber of the eye. Contact lenses should not be worn during treatment for bacterial conjunctivitis. Indications for ophthalmic solutions are product concentration-specific and should not be used interchangeably.

Geriatric ConsiderationsThe risk of torsade de pointes and tendon inflammation and/or rupture associated with the concomitant use of corticosteroids and quinolones is increased in the elderly population. See Warnings/Precautions regarding tendon rupture in patients >60 years of age. Adjust dose for renal function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in some animal studies; therefore, the manufacturer classifies levofloxacin as pregnancy category C. Levofloxacin crosses the placenta. Quinolone exposure during human pregnancy has been reported with other agents (see Ciprofloxacin, Ofloxacin, and Norfloxacin monographs). To date, no specific teratogenic effect or increased pregnancy risk has been identified; however, because of concerns of cartilage damage in immature animals exposed to quinolones and the limited levofloxacin specific data, levofloxacin should only be used during pregnancy if a safer option is not available.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsBased on data from a case report, small amounts of levofloxacin are excreted in breast milk. Breast-feeding is not recommended by the manufacturer. Levofloxacin is the L-isomer of ofloxacin. Ofloxacin has also been shown to have minimal concentrations in human milk and is considered “usually compatible with breastfeeding” by the AAP. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Levofloxacin in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Cardiovascular: Chest pain (1%), edema (1%)

Central nervous system: Headache (6%), insomnia (4%), dizziness (3%), fatigue (1%), pain (1%)

Dermatologic: Rash (2%), pruritus (1%)

Gastrointestinal: Taste disturbance (8% to 10% [ophthalmic]), nausea (7%), diarrhea (5%), constipation (3%), abdominal pain (2%), dyspepsia (2%), vomiting (2%)

Genitourinary: Vaginitis (1%)

Local: Injection site reaction (1%)

Ocular (with ophthalmic solution use): Decreased vision (transient), foreign body sensation, transient ocular burning, ocular pain or discomfort, photophobia

Respiratory: Pharyngitis (4%), dyspnea (1%)

Miscellaneous: Moniliasis (1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening):

Systemic: Acute renal failure, agitation, agranulocytosis; allergic reaction (including anaphylaxis, angioedema, pneumonitis rash, pneumonitis, and serum sickness); anaphylactoid reaction, arrhythmia (including atrial/ventricular tachycardia/fibrillation and torsade de pointes), aplastic anemia, arthralgia, ascites, bradycardia, bronchospasm, carcinoma, cardiac failure, cholecystitis, cholelithiasis, confusion, depression, EEG abnormalities, encephalopathy, eosinophilia, erythema multiforme, GI hemorrhage, granulocytopenia, hallucination, heart block, hemolytic anemia, hemoptysis, hepatic failure (some fatal), hepatitis, hyper-/hypoglycemia, hyperkalemia, hyperkinesias, hyper-/hypotension, infection, INR increased, intestinal obstruction, intracranial hypertension, involuntary muscle contractions, jaundice, leukocytosis, leukopenia, leukorrhea, lymphadenopathy, MI, migraine, multiple organ failure, myalgia, nephritis (interstitial), palpitation, pancreatitis, pancytopenia, paralysis, paresthesia, peripheral neuropathy, photosensitivity (<0.1%), pleural effusion, pneumonitis, postural hypotension, prothrombin time increased/decreased, pseudomembraneous colitis, psychosis, pulmonary edema, pulmonary embolism, purpura, QT_c prolongation, respiratory depression, rhabdomyolysis, seizure, skin disorder, somnolence, speech disorder, Stevens-Johnson syndrome, stupor, suicide attempt/ideation, syncope, tendonitis, tendon rupture, tongue edema, toxic epidermal necrolysis, transaminases increased, thrombocythemia, thrombocytopenia, tremor, urticaria, WBC abnormality

Ophthalmic solution: Allergic reaction, lid edema, ocular dryness, ocular itching

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Calcium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Calcium Chloride. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Quinolone Antibiotics may enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Insulin: May enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sulfonylureas: Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Monitoring ParametersEvaluation of organ system functions (renal, hepatic, ophthalmologic, and hematopoietic) is recommended periodically during therapy; the possibility of crystalluria should be assessed; WBC and signs of infection

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests prior to beginning therapy. Use caution in patients with known or suspected CNS disorder, current or potential for QT prolongation, renal or hepatic impairment, or diabetes. Assess other pharmacological or herbal products patient may be taking for potential interactions. See Administration for infusion specifics. Patient should be monitored closely; if an allergic reaction occurs (itching, urticaria, dyspnea or facial edema, loss of consciousness, tingling, cardiovascular collapse), drug should be discontinued immediately and prescriber notified. Evaluate results of laboratory tests, therapeutic effectiveness (resolution of infection), and adverse reactions (eg, hypersensitivity reactions [severe reactions, including anaphylaxis, have occurred with quinolone therapy], opportunistic infection, tendon rupture, persistent diarrhea [*C. difficile*-associated colitis can occur up to 2 months post treatment]) regularly during prolonged therapy. Teach patient proper use (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating drug therapy. Monitor CBC periodically during therapy. Monitor renal or hepatic function if therapy is prolonged.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. If administered by infusion, report immediately any chest or back pain; tightness in chest; difficulty swallowing; swelling of face or mouth; or redness, swelling, or pain at infusion site.

Oral: Take exactly as directed (timing with meals, dairy products, antacids, or products containing calcium, iron, or zinc differs with each formulation). Take entire prescription, even if feeling better. If you have diabetes, monitor glucose levels closely; may cause hypoglycemia. May cause dizziness, lightheadedness, or confusion (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid exposure to direct sunlight or tanning situations). Report chest pain or palpitations; persistent diarrhea, abdominal pain, or constipation; signs of infection (unusual fever or chills, vaginal itching, or foul-smelling vaginal discharge); unusual bruising or bleeding; or other persistent adverse effects. If tendon inflammation or pain occurs or you experience signs of an allergic reaction (eg, itching, skin rash, respiratory difficulty, facial edema, difficulty swallowing, chest pain, palpitations) discontinue use and contact prescriber immediately. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Ophthalmic: Wash hands before instilling solution. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of solution. Close eye, roll eye in all directions, and apply gentle pressure to inner corner of eye. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Temporary stinging or blurred vision may occur. Report persistent pain, burning, vision changes, swelling, itching, or worsening of condition. Discontinue medication and contact prescriber immediately if you develop a rash or allergic reaction. Do not wear contact lenses.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion, premixed in D_5W [preservative free]:

Levaquin®: 250 mg (50 mL); 500 mg (100 mL); 750 mg (150 mL)

Injection, solution [preservative free]

Levaquin®: 25 mg/mL (20 mL, 30 mL)

Solution, ophthalmic [drops]:

Iquix®: 1.5% (5 mL)

Quixin®: 0.5% (5 mL) [contains benzalkonium chloride]

Solution, oral:

Levaquin®: 25 mg/mL (480 mL) [contains benzyl alcohol, propylene glycol]

Tablet, oral:

Levaquin®: 250 mg, 500 mg, 750 mg

Levaquin® Leva-Pak: 750 mg (5s)

Generic AvailableNo

ManufacturerOrtho-McNeil Pharmaceutical, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Levaquin)

250 mg (10): $119.91

500 mg (10): $139.09

750 mg (30): $773.29

Tablets (Levaquin LEVA-pak)

750 mg (5): $130.69

Mechanism of ActionAs the S (-) enantiomer of the fluoroquinolone, ofloxacin, levofloxacin, inhibits DNA-gyrase in susceptible organisms thereby inhibits relaxation of supercoiled DNA and promotes breakage of DNA strands. DNA gyrase (topoisomerase II), is an essential bacterial enzyme that maintains the superhelical structure of DNA and is required for DNA replication and transcription, DNA repair, recombination, and transposition.

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: V_d: 74-112 L; CSF concentrations ~15% of serum levels; high concentrations are achieved in prostate, lung, and gynecological tissues, sinus, saliva

Protein binding: ~24% to 38%; primarily to albumin

Metabolism: Minimally hepatic

Bioavailability: ~99%

Half-life elimination: ~6-8 hours

Time to peak, serum: Oral: 1-2 hours

Excretion: Urine (~87% as unchanged drug, <5% as metabolites); feces (<4%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsLevofloxacin is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause agitation, anxiety, confusion, depression, dizziness, hallucinations, insomnia, nervousness, paranoia, and sedation

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; inhibits CYP1A2 isoenzyme; caution with clozapine and other psychotropics; monitor for adverse effects

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

LEVOleucovorin may be confused with leucovorin calcium, Leukeran®, Leukine®

Pronunciation

(lee voe loo koe VOR in)

U.S. Brand NamesFusilev™

Pharmacologic CategoryAntidote; Rescue Agent (Chemotherapy)

Use: Labeled IndicationsRescue agent after high-dose methotrexate therapy in osteosarcoma; antidote for impaired methotrexate elimination and for inadvertent overdosage of folic acid antagonists

Use: Unlabeled/InvestigationalTreatment of colorectal cancer (in combination with fluorouracil)

Dosing: Adults**Note:** Levoleucovorin is dosed at **one-half** the usual dose of the racemic form (leucovorin calcium):

High-dose methotrexate rescue: I.V.: Usual dose: 7.5 mg (~5 mg/m^2) every 6 hours for 10 doses, beginning 24 hours after the start of the methotrexate infusion (based on a methotrexate dose of 12 g/m^2 I.V. over 4 hours). Levoleucovorin (and hydration and urinary alkalinization) should be continued and/or adjusted until the methotrexate level is <0.05 micromolar (5 x 10^{-8} M) as follows:

Normal methotrexate elimination (serum methotrexate levels ~10 micromolar at 24 hours post administration, 1 micromolar at 48 hours and <0.2 micromolar at 72 hours post infusion): 7.5 mg I.V. every 6 hours for 10 doses

Delayed late methotrexate elimination (serum methotrexate levels >0.2 micromolar at 72 hours and >0.05 micromolar at 96 hours post methotrexate infusion): Continue 7.5 mg I.V. every 6 hours until methotrexate level is <0.05 micromolar

Delayed early methotrexate elimination and/or evidence of acute renal injury (serum methotrexate level ≥50 micromolar at 24 hours, ≥5 micromolar at 48 hours or a doubling or more of the serum creatinine level at 24 hours post methotrexate infusion): 75 mg I.V. every 3 hours until methotrexate level is <1 micromolar, followed by 7.5 mg I.V. every 3 hours until methotrexate level is <0.05 micromolar

Significant clinical toxicity in the presence of less severe abnormalities in methotrexate elimination or renal function (as described above): Extend levoleucovorin treatment for an additional 24 hours (total of 14 doses) in subsequent treatment cycles.

Delayed methotrexate elimination due to third space fluid accumulation, renal insufficiency, or inadequate hydration: May require higher levoleucovorin doses or prolonged administration.

Methotrexate overdose (inadvertent): I.V.: 7.5 mg (~5 mg/m^2) every 6 hours; continue until the methotrexate level is <0.01 micromolar (10^{-8} M). Initiate treatment as soon as possible after methotrexate overdose. Increase the levoleucovorin dose to 50 mg/m^2 I.V. every 3 hours if the 24-hour serum creatinine has increased 50% over baseline, or if the 24 hour methotrexate level is >5 micromolar (5 x 10^{-6} M), or if the 48-hour methotrexate level is >0.9 micromolar (9 x 10^{-7} M); continue levoleucovorin until the methotrexate level is <0.01 micromolar (10^{-8} M). Hydration (3 L/day) and urinary alkalinization (with sodium bicarbonate) should also be maintained.

Treatment of colorectal cancer (in combination with fluorouracil; unlabeled use): I.V.: Levoleucovorin is dosed at **one-half** the usual dose of the racemic form (leucovorin)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Levoleucovorin is dosed at **one-half** the usual dose of the racemic form (leucovorin calcium):

High-dose methotrexate rescue: Refer to adult dosing.

Methotrexate overdose (inadvertent): Refer to adult dosing.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.For I.V. administration only; do not administer intrathecally. Due to calcium content, do not administer I.V. solutions at a rate >160 mg/minute.

For colorectal cancer (unlabeled use): Levoleucovorin has been administered as I.V. push and as I.V. infusion over 2 hours in clinical trials.

Administration: OtherDo not administer intrathecally.

StoragePrior to reconstitution, store intact vials at 25°C (77°F); excursions permitted up to 15°C to 30°C (59°F to 86°F). Protect from light.

Reconstituted solutions in the vial and further diluted for infusion in NS are stable for 12 hours at room temperature. Solutions further diluted for infusion in D_5W are stable for 4 hours at room temperature.

ReconstitutionReconstitute the 50 mg vial with 5.3 mL NS (preservative free) to a concentration of 10 mg/mL. Do not use if solution appears cloudy or contains a precipitate. May further dilute for infusion in NS or D_5W to a final concentration of 0.5-5 mg/mL.

CompatibilityStable in NS, D_5W

ContraindicationsHistory of prior allergic reaction to folic acid or leucovorin (folinic acid)

Warnings/Precautions

Concurrent drug therapy issues:

- Fluorouracil: The toxicity of fluorouracil is enhanced by leucovorin and levoleucovorin. Deaths due to severe enterocolitis, diarrhea, and dehydration have been reported in elderly patients receiving weekly leucovorin in combination with fluorouracil.
- Sulfamethoxazole-trimethoprim: Concomitant use of leucovorin and sulfamethoxazole-trimethoprim for the acute treatment of PCP in patients with HIV infection has been associated with increased rates of treatment failure and morbidity; may also occur with levoleucovorin.

Other warnings/precautions:

- Administration: For I.V. administration only; do not administer intrathecally. Due to calcium content, do not administer I.V. solutions at a rate >160 mg levoleucovorin/minute.
- Appropriate use: Levoleucovorin is not approved for and should not be used to treat pernicious anemia or megaloblastic anemias secondary to vitamin B_{12} deficiency; improper use may induce hematologic remission with progressive neurologic manifestations.
- Folic acid antagonist overdose: When used for the treatment of accidental folic acid antagonist overdose, administer as soon as possible.
- Methotrexate rescue therapy: Methotrexate serum concentrations should be monitored to determine dose and duration of levoleucovorin therapy. Dose may need to be increased or administration prolonged in situations where methotrexate excretion may be delayed (eg, ascites, pleural effusion, renal insufficiency, inadequate hydration).

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Levoleucovorin is the levo isomeric form of racemic leucovorin, a biologically active form of folic acid. Adequate amounts of folic acid are recommended during pregnancy. Refer to Folic Acid monograph.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsLevoleucovorin is the levo isomeric form of racemic leucovorin, a biologically active form of folic acid. Adequate amounts of folic acid are recommended in breast-feeding women. Refer to Folic Acid monograph.

Adverse Reactions**Note:** Adverse reactions reported with levoleucovorin following high-dose methotrexate treatment.

>10%: Gastrointestinal: Stomatitis (38%), vomiting (38%), nausea (19%)

1% to 10%:

Central nervous system: Confusion (6%)

Dermatologic: Dermatitis (6%)

Gastrointestinal: Diarrhea (6%), dyspepsia (6%), taste perversion (6%), typhlitis (6%)

Neuromuscular & skeletal: Neuropathy (6%)

Renal: Renal function abnormal (6%)

Respiratory: Dyspnea (6%)

<1%, postmarketing, and/or case reports: Pruritus, rash, rigors, temperature changes

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Capecitabine: Leucovorin-Levoleucovorin may enhance the adverse/toxic effect of Capecitabine. *Risk C: Monitor therapy*

Fluorouracil: Leucovorin-Levoleucovorin may enhance the adverse/toxic effect of Fluorouracil. This effect is associated with the ability of leucovorin or levoleucovorin to enhance the anticancer effects of fluorouracil. *Risk C: Monitor therapy*

PHENobarbital: Leucovorin-Levoleucovorin may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Leucovorin-Levoleucovorin may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Primidone: Leucovorin-Levoleucovorin may decrease the serum concentration of Primidone. Additionally, leucovorin/levoleucovorin may decrease concentrations of active metabolites of primidone (e.g., phenobarbital). *Risk C: Monitor therapy*

Raltitrexed: Leucovorin-Levoleucovorin may diminish the therapeutic effect of Raltitrexed. *Risk X: Avoid combination*

Trimethoprim: Leucovorin-Levoleucovorin may diminish the therapeutic effect of Trimethoprim. *Risk D: Consider therapy modification*

Monitoring ParametersHigh-dose methotrexate therapy: Serum methotrexate and creatinine levels at least once daily. Monitor fluid and electrolyte status in patients with delayed methotrexate elimination (likely to experience renal toxicity).

Nursing: Physical Assessment/MonitoringTeach patient side effects and symptoms to report. Monitor laboratory tests, adverse reactions, and therapeutic response.

Monitoring: Lab TestsHigh-dose methotrexate therapy: Serum methotrexate and creatinine levels at least once daily. Monitor fluid and electrolyte status in patients with delayed methotrexate elimination (likely to experience renal toxicity).

Patient EducationYou may experience nausea and vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help), diarrhea (buttermilk, boiled milk, or yogurt may help), heartburn, change in taste, sores in mouth or on skin. Report respiratory difficulty, confusion, decreased urine output, swelling of extremities and unusual weight gain, or lethargy. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strength expressed as base.

Injection, powder for reconstitution:

Fusilev™: 50 mg

Generic AvailableNo

ManufacturerSpectrum Pharmaceuticals, Inc

Mechanism of ActionLevoleucovorin counteracts the toxic (and therapeutic) effects of folic acid antagonists (eg, methotrexate) which act by inhibiting dihydrofolate reductase. Levoleucovorin is the levo isomeric and pharmacologic active form of leucovorin (levoleucovorin does not require reduction by dihydrofolate reductase). A reduced derivative of folic acid, leucovorin supplies the necessary cofactor blocked by methotrexate, enters the cells via the same active transport system as methotrexate.

Leucovorin enhances the activity (and toxicity) of fluorouracil by stabilizing the binding of 5-dUMP and thymidylate synthetase.

Pharmacodynamics/Kinetics

Metabolism: Converted to the active reduced form of folate, 5-methyl-tetrahydrofolate (5-methyl-THF; active)

Half-life elimination: 15 mg: 5-7 hours; 300 mg: elimination half life: 16-30 hours

Time to peak, serum: I.V.: 0.9 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion

Mental Health: Effects on Psychiatric TreatmentLevoleucovorin may decrease the serum concentration of primidone, phenytoin, and phenobarbital

Index Terms6S-leucovorin; Calcium Levoleucovorin; L-leucovorin; Levo-folinic Acid; Levo-leucovorin; Levoleucovorin Calcium Pentahydrate; S-leucovorin

Levonorgestrel

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(LEE voe nor jes trel)
U.S. Brand NamesMirena®; Plan B® [RX/OTC]
Canadian Brand NamesMirena®; Norplant® Implant; Plan B™
Pharmacologic CategoryContraceptive; Progestin
Use: Labeled Indications

Intrauterine device (IUD): Prevention of pregnancy

Oral: Emergency contraception following unprotected intercourse or possible contraceptive failure

Use: Unlabeled/InvestigationalIUD: Idiopathic menorrhagia; protection against endometrial hyperplasia in menopausal women using estrogen
Dosing: AdultsFemales:

Long-term prevention of pregnancy: Intrauterine device (Mirena®): To be inserted into uterine cavity; should be inserted within 7 days of onset of menstruation or immediately after 1st trimester abortion. Releases 20 mcg levonorgestrel/day over 5 years. May be removed and replaced with a new unit at anytime during menstrual cycle. Do not leave any one system in place for >5 years.

Emergency contraception: Oral tablet (Plan B™): One 0.75 mg tablet as soon as possible within 72 hours of unprotected sexual intercourse. A second 0.75 mg tablet should be taken 12 hours after the first dose; may be used at any time during menstrual cycle.

Unlabeled dosing for emergency contraception: Two 0.75 mg tablets as a single dose **or** one 0.75 mg tablet followed by a second 0.75 mg tablet within 12-24 hours. Either regimen should be taken as soon as possible, but within 120 hours, following unprotected sexual intercourse.

Dosing: ElderlyNot indicated for use in postmenopausal women.
Dosing: Renal ImpairmentSafety and efficacy have not been established.
Dosing: Hepatic ImpairmentSafety and efficacy have not been established; use of the intrauterine device is contraindicated with active hepatic disease or hepatic tumor.
Administration: OtherIntrauterine device: Inserted in the uterine cavity, to a depth of 6-9 cm, with the provided insertion device; should not be forced into the uterus
StorageStore at room temperature of 25°C (77°F).
RestrictionsPlan B® is approved for OTC use by women ≥18 years of age and available by prescription only for women ≤17 years of age. Sales of Plan B® will be limited to pharmacies or healthcare clinics with a valid license to distribute prescription products. Because there will be one package for both OTC and prescription use, pharmacies are required to keep the product behind the counter.
ContraindicationsHypersensitivity to levonorgestrel or any component of the formulation; pregnancy
Additional product-specific contraindications:

Intrauterine device: Congenital or acquired uterine anomaly, acute pelvic inflammatory disease, history of pelvic inflammatory disease (unless there has been a subsequent intrauterine pregnancy), postpartum endometritis or infected abortion within past 3 months, known or suspected uterine or cervical neoplasia, unresolved/abnormal Pap smear, untreated acute cervicitis or vaginitis, conditions which increase susceptibility to pelvic infections, unremoved IUD, undiagnosed abnormal uterine bleeding, active hepatic disease or hepatic tumors, known or suspected carcinoma of the breast

Oral: It is not known if the same contraindications associated with long term progestin only contraceptives apply to the use of levonorgestrel and the emergency 2-dose regimen. A history of ectopic pregnancy is not a contraindication to use in emergency contraception.

Warnings/Precautions

Concerns related to adverse effects:

- Abdominal pain: Patients taking progestin-only contraceptives and presenting with lower abdominal pain should be evaluated for follicular atresia and ectopic pregnancy.

- Bleeding irregularities: Menstrual bleeding patterns may be altered with use of the intrauterine device; the possibility of pregnancy should be considered if menstruation does not occur within 6 weeks of the previous menstrual period. If bleeding irregularities continue with prolonged use, appropriate diagnostic measures should be taken to rule out endometrial pathology. An increase in menstrual bleeding may indicate a partial or complete expulsion of the IUD. If expulsion occurs, device may be replaced within 7 days once pregnancy is ruled out. When using the oral tablet, the possibility of pregnancy should be considered if menstruation is delayed for >7 days of the expected menstrual period.

- Bradycardia/syncope: Bradycardia or syncope may occur during insertion or removal of the intrauterine device.

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in the frequency of breast cancer, however, studies are not consistent. Data is insufficient to determine if progestin only contraceptives also increase this risk.

- Carbohydrate intolerance: May have adverse effects on glucose tolerance; use caution in women with diabetes.

- Ectopic pregnancy: Use caution in patients with previous ectopic pregnancy. Women with history of ectopic pregnancy were excluded from clinical trials; women with previous ectopic pregnancy, tubal surgery or pelvic infection may be at increased risk ectopic pregnancy. The possibility of ectopic pregnancy should be considered in patients with abdominal pain or vaginal bleeding in women with prior amenorrhea.

Disease-related concerns:

- Renal impairment: Safety and efficacy have not been established for use in renal impairment.

Concurrent drug therapy issues:

- Hepatic enzyme-inducing medications: Patients receiving hepatic enzyme-inducing medications should be evaluated for an alternative method of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.

- Postmenopausal women: Not indicated for use in postmenopausal women.

- Smokers: The risk of cardiovascular side effects increases in women using estrogen containing combined hormonal contraceptives and who smoke cigarettes, especially those who are >35 years of age. This risk relative to progestin-only contraceptives has not been established. Women who take contraceptives should be advised not to smoke.

Dosage form specific issues:

- Intrauterine device: Increased incidence of group A streptococcal sepsis and pelvic inflammatory disease (may be asymptomatic). May perforate uterus or cervix; risk of perforation is increased in lactating women. Pregnancy may result if perforation occurs; delayed detection of perforation may result in migration of IUD outside of uterine cavity. Partial penetration or embedment in the myometrium may decrease effectiveness and lead to difficult removal. Use caution in patients with coagulopathy or receiving anticoagulants. Use caution in patients with congenital heart disease or other heart conditions which may increase the risk of infective endocarditis during insertion of the device (prophylactic antibiotics may be required at time of insertion).

- Oral tablet: Not intended to be used for routine contraception and will not terminate an existing pregnancy.

Other warnings/precautions:

- Appropriate use: Intrauterine device: Insertion should be done by a trained health care provider. The device should be removed for the following reasons: Bleeding which causes anemia; if the patient or her partner become HIV positive or acquire a sexually-transmitted disease; pelvic infection, endometritis, symptomatic genital actinomycosis; intractable pelvic pain, pain during intercourse; endometrial or cervical cancer; uterine or cervical perforation; pregnancy. Embedded devices should also be removed. Use with caution or consider removal of the intrauterine device if any of the following conditions occur for the first time during therapy: Migraine, severe headache, jaundice, marked increase in blood pressure, severe arterial disease (eg, stroke, MI). Use is contraindicated in patients with vaginitis or cervicitis. Postpone insertion until after treatment for infection is complete and cause of the cervicitis is proven not to be due to gonorrhea or chlamydia.

- HIV infection protection: Hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.

Pregnancy Risk FactorX
Pregnancy ConsiderationsEpidemiologic studies have not shown an increased risk of birth defects when used prior to pregnancy or inadvertently during early pregnancy, although rare reports of congenital anomalies have been reported. In doses larger than those used for oral contraception, progestins have been reported to increase the risk of masculinization of female genitalia.

Intrauterine device: Pregnancy should be ruled out prior to insertion. Women who become pregnant with an IUD in place risk septic abortion (septic shock and death may occur). Removal of the device is recommended, however, removal or manipulation of IUD may result in pregnancy loss. In addition, miscarriage, premature labor, and premature delivery may occur if pregnancy is continued with IUD in place. Following pregnancy, insertion of the device should not take place until 6 weeks postpartum or until involution of the uterus is complete. Consider waiting until 12 weeks postpartum if involution is substantially delayed. The device may be inserted immediately following a first trimester abortion. Following removal of the device, ~80% of women who wished to conceive became pregnant within 12 months.

LactationEnters breast milk/use caution (AAP rates “compatible”)
Breast-Feeding ConsiderationsLevonorgestrel is found in breast milk. Following long-term use of oral levonorgestrel, infant serum levels range from 1% to 6% of the maternal level; detectable levels may be found in nursing infants. Isolated cases of decreased milk production have been reported. Risk of perforation with IUD is increased in lactating women. Following pregnancy, insertion of the device should not take place until 6 weeks postpartum or until involution of the uterus is complete. Consider waiting until 12 weeks postpartum if involution is substantially delayed.
Adverse Reactions
Intrauterine device:

>5%:

Cardiovascular: Hypertension

Central nervous system: Headache, depression, nervousness

Dermatologic: Acne

Endocrine & metabolic: Breast pain, dysmenorrhea, libido decreased, amenorrhea (20% at 1 year), enlarged follicles (12%), ovarian cysts

Gastrointestinal: Abdominal pain, nausea, weight gain

Genitourinary: Cervicitis, leukorrhea, pelvic pain, uterine/vaginal bleeding, vaginitis

Neuromuscular & skeletal: Back pain

<5%, postmarketing and/or case reports: Abdominal distension, alopecia, anemia, angioedema, device breakage, dyspareunia, eczema, edema, failed insertion, hirsutism, migraine, mood changes, pruritus, rash,sepsis, urticaria, vomiting

Oral tablets:

>10%:

Central nervous system: Fatigue (17%), headache (17%), dizziness (11%)

Endocrine & metabolic: Heavier menstrual bleeding (14%), lighter menstrual bleeding (12%), breast tenderness (11%)

Gastrointestinal: Nausea (23%), abdominal pain (18%)

1% to 10%: Gastrointestinal: Vomiting (6%), diarrhea (5%)

Metabolism/Transport Effects **Substrate** of CYP3A4 (major)
Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Herb/Nutraceutical: St John's wort (an enzyme inducer) may decrease serum levels of levonorgestrel.
Test Interactions Decreased concentrations of sex hormone-binding globulin; decreased thyroxine concentrations (slight); increased triiodothyronine uptake

Monitoring ParametersIUD: Re-examine 4-12 weeks following insertion and then yearly. Threads should be visible; if length of thread has changed device may have become displaced, broken, perforated the uterus, or expelled. Transvaginal ultrasound may be used to check placement. Monitor for prolonged menstrual bleeding, amenorrhea, irregularity of menses, Pap smear, blood pressure, serum glucose in patients with diabetes, LDL levels in patients with hyperlipidemias; re-examine following first menses post-insertion of IUD. Patients presenting with lower abdominal pain should be evaluated for follicular atresia and ectopic pregnancy. Signs of infection following IUD insertion, especially in patients at increased risk (eg, patients on chronic corticosteroids, patients with type 1 diabetes mellitus).

Reference RangeIntrauterine device: Plasma levels range from 150-200 pg/mL which are lower than those observed with other dosage forms of levonorgestrel

Nursing: Physical Assessment/MonitoringPregnancy should be ruled out prior to insertion of IUD. Monitor for prolonged menstrual bleeding, amenorrhea, irregularity of menses, and other adverse effects. Caution patient about need for annual medical exams. **Pregnancy risk factor X.**

Monitoring: Lab TestsIUD: Monitor serum glucose in patients with diabetes, LDL levels in patients with hyperlipidemias

Patient EducationThis drug does not protect against HIV infection or other sexually-transmitted diseases. Cigarette smoking is not recommended. You may experience cramping, headache, abdominal discomfort, hair loss, weight changes, or unusual menses (breakthrough bleeding, irregularity, excessive bleeding). Report sudden acute headache or visual disturbance, unusual nausea or vomiting, any loss of feeling in arms or legs, or lower abdominal pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding

Intrauterine device: This method provides up to 5 years of birth control from a T-shaped device inserted into the uterus. It will be inserted and removed by your prescriber. Notify your prescriber if the system comes out by itself, if you have long-lasting or heavy bleeding, unusual vaginal discharge, low abdominal pain, painful sexual intercourse, chills or fever. There is an increased risk of ectopic pregnancy with this product. Thread placement should be checked following each menstrual cycle; do not pull thread.

Tablet: This method provides emergency contraception. It is used after your normal form of birth control has failed, or following unprotected sexual intercourse. It should be used within 72 hours. Contact prescriber if you vomit within 1 hour of taking either dose.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Intrauterine device:

Mirena®: 52 mg/unit [releases levonorgestrel 20 mcg/day]

Tablet:

Plan B®: 0.75 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Plan B)

0.75 mg (2): $47.38

Mechanism of ActionPregnancy may be prevented through several mechanisms: Thickening of cervical mucus, which inhibits sperm passage through the uterus and sperm survival; inhibition of ovulation, from a negative feedback mechanism on the hypothalamus, leading to reduced secretion of follicle stimulating hormone (FSH) and luteinizing hormone (LH); and inhibition of implantation. Levonorgestrel is not effective once the implantation process has begun.

Pharmacodynamics/Kinetics

Duration: Intrauterine device: Up to 5 years

Absorption: Oral: Rapid and complete

Protein binding: Highly bound to albumin (~50%) and sex hormone-binding globulin (~47%)

Metabolism: To inactive metabolites

Half-life elimination: Oral: ~24 hours

Excretion: Primarily urine

Pharmacotherapy PearlsIntrauterine device: The cumulative 5-year pregnancy rate is ~0.7 pregnancies/100 users. Over 70% of women in the trials had previously used IUDs. The reported pregnancy rate after 12 months was ≤0.2 pregnancies/100 users. Approximately 80% of women who wish to conceive have become pregnant within 12 months of device removal. The recommended patient profile for this product: A woman who has at least one child, is in a stable and mutually-monogamous relationship, no history of pelvic inflammatory disease, and no history of ectopic pregnancy or predisposition to ectopic pregnancy. Keep a copy of the consent form and record lot number of device.

Oral tablet: When used as directed for emergency contraception, the expected pregnancy rate is decreased from 8% to 1%. Approximately 87% of women have their next menstrual period at approximately the expected time. A rapid return to fertility following use is expected.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness or dizziness

Mental Health: Effects on Psychiatric TreatmentCarbamazepine may decrease the effects of levonorgestrel

Index TermsLNg 20

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(lee VOR fa nole)

U.S. Brand NamesLevo-Dromoran®

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsRelief of moderate to severe pain; also used parenterally for preoperative sedation and an adjunct to nitrous oxide/oxygen anesthesia

Dosing: Adults**Note:** These are guidelines and do not represent the maximum doses that may be required in all patients. Doses should be titrated to pain relief/prevention.

Acute pain (moderate to severe):

Oral: Initial: Opiate-naive: 2 mg every 6-8 hours as needed; patients with prior opiate exposure may require higher initial doses; usual dosage range: 2-4 mg every 6-8 hours as needed

I.M., SubQ: Initial: Opiate-naive: 1 mg every 6-8 hours as needed; patients with prior opiate exposure may require higher initial doses; usual dosage range: 1-2 mg every 6-8 hours as needed

I.V. (slow): Initial: Opiate-naive: Up to 1 mg/dose every 3-6 hours as needed; patients with prior opiate exposure may require higher initial doses

Chronic pain: Patients taking opioids chronically may become tolerant and require doses higher than the usual dosage range to maintain the desired effect. Tolerance can be managed by appropriate dose titration. **There is no optimal or maximal dose for levorphanol in chronic pain. The appropriate dose is one that relieves pain throughout its dosing interval without causing unmanageable side effects.**

Premedication: I.M., SubQ: 1-2 mg/dose 60-90 minutes prior to surgery; older or debilitated patients usually require less drug

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentReduce dose in patients with liver disease.

Calculations

- Opioid Agonist Conversion

Administration: I.V.Inject 3 mg over 4-5 minutes

Administration: I.V. DetailpH: 4.3 (adjusted)

Administration: OralFor lactating women, administer 4-6 hours prior to breast-feeding.

StorageStore at room temperature; do not freeze.

Compatibility

Y-site administration: Compatible: Propofol.

Compatibility in syringe: Compatible: Glycopyrrolate.

Compatibility when admixed: Incompatible: Aminophylline, ammonium chloride, amobarbital, chlorothiazide, heparin, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, thiopental.

RestrictionsC-II

ContraindicationsHypersensitivity to levorphanol or any component of the formulation; pregnancy (prolonged use or high doses at term)

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydrocodone, hydromorphone, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe liver dysfunction.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with severe renal insufficiency.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Sulfites: Some preparations contain sulfites which may cause allergic reactions.

Other warnings/precautions:

- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.
- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics.
Pregnancy Risk FactorB/D (prolonged use or high doses at term)
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, hypotension, bradycardia, peripheral vasodilation, cardiac arrest, shock, tachycardia

Central nervous system: CNS depression, fatigue, drowsiness, dizziness, nervousness, headache, restlessness, anorexia, malaise, confusion, coma, convulsion, insomnia, amnesia, mental depression, hallucinations, paradoxical CNS stimulation, intracranial pressure increased

Dermatologic: Pruritus, urticaria, rash

Endocrine & metabolic: Antidiuretic hormone release

Gastrointestinal: Nausea, vomiting, dyspepsia, stomach cramps, xerostomia, constipation, abdominal pain, dry mouth, biliary tract spasm, paralytic ileus

Genitourinary: Decreased urination, urinary tract spasm, urinary retention

Local: Pain at injection site

Neuromuscular & skeletal: Weakness

Ocular: Miosis, diplopia

Respiratory: Respiratory depression, apnea, hypoventilation, cyanosis

Miscellaneous: Histamine release, physical and psychological dependence

Oncology: VesicantNo

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersPain relief, respiratory and mental status, blood pressure

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness, adverse reactions, and signs of overdose. Monitor vital signs, CNS and respiratory status, at beginning of therapy and at regular intervals with long-term use. May cause physical and/or psychological dependence. Safety measures required for inpatients. Assess knowledge/teach patient appropriate use (if self-administered). Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects. Discontinue slowly after prolonged use.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); loss of appetite, nausea, or vomiting (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report chest pain, slow or rapid heartbeat, acute dizziness, or persistent headache; swelling of extremities or unusual weight gain; changes in urinary elimination; acute headache; back or flank pain or spasms; blurred vision; skin rash; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as tartrate: 2 mg/mL (1 mL, 10 mL)

Tablet, as tartrate: 2 mg

Generic AvailableYes: Tablet

Mechanism of ActionLevorphanol tartrate is a synthetic opioid agonist that is classified as a morphinan derivative. Opioids interact with stereospecific opioid receptors in various parts of the central nervous system and other tissues. Analgesic potency parallels the affinity for these binding sites. These drugs do not alter the threshold or responsiveness to pain, but the perception of pain.

Pharmacodynamics/Kinetics

Onset of action: Oral: 10-60 minutes

Duration: 4-8 hours

Metabolism: Hepatic

Half-life elimination: 11-16 hours

Excretion: Urine (as inactive metabolite)

Related Information

- Narcotic / Opioid Analgesics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may cause nervousness, restlessness, or confusion; may rarely cause depression, hallucinations, or paradoxical CNS stimulation

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

Index TermsLevorphan Tartrate; Levorphanol Tartrate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Levothyroxine may be confused with levofloxacin, liothyronine

Levoxyl® may be confused with Lanoxin®, Levaquin®, Luvox®

Synthroid® may be confused with Symmetrel®

To avoid errors due to misinterpretation of a decimal point, always express dosage in mcg (**not** mg).

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

Pronunciation(lee voe thye ROKS een)

U.S. Brand NamesLevothroid®; Levoxyl®; Synthroid®; Unithroid®

Canadian Brand NamesEltroxin®; Euthyrox; Levothyroxine Sodium; Synthroid®

Pharmacologic CategoryThyroid Product

Use: Labeled IndicationsReplacement or supplemental therapy in hypothyroidism; pituitary TSH suppression

Dosing: AdultsDoses should be adjusted based on clinical response and laboratory parameters.

Hypothyroidism:

Oral: 1.7 mcg/kg/day in otherwise healthy adults <50 years old, children in whom growth and puberty are complete, and older adults who have been recently treated for hyperthyroidism or who have been hypothyroid for only a few months. Titrate dose every 6 weeks. Average full replacement dose is 100-125 mcg/day for a 70 kg adult; usual doses are ≤200 mcg/day; doses ≥300 mcg/day are rare (consider poor compliance, malabsorption, and/or drug interactions). **Note:** For patients >50 years or patients with cardiac disease, refer to elderly dosing.

I.M., I.V.: 50% of the oral dose

Severe hypothyroidism: Oral: Initial: 12.5-25 mcg/day; adjust dose by 25 mcg/day every 2-4 weeks as appropriate

Subclinical hypothyroidism (if treated): Oral: 1 mcg/kg/day

TSH suppression: Oral:

Well-differentiated thyroid cancer: Highly individualized; Doses >2 mcg/kg/day may be needed to suppress TSH to <0.1 mU/L. High-risk tumors may need a target level of <0.01 mU/L for TSH suppression.

Benign nodules and nontoxic multinodular goiter: Goal TSH suppression: 0.1-0.5 mU/L (benign nodules) and 0.5-1 mU/L (multinodular goiter)

Myxedema coma or stupor: I.V.: 200-500 mcg, then 100-300 mcg the next day if necessary; smaller doses should be considered in patients with cardiovascular disease

Dosing: ElderlyDoses should be adjusted based on clinical response and laboratory parameters.

Hypothyroidism:

Oral:

>50 years without cardiac disease **or** <50 years with cardiac disease: Initial: 25-50 mcg/day; adjust dose at 6- to 8-week intervals as needed

>50 years with cardiac disease: Initial: 12.5-25 mcg/day; adjust dose by 12.5-25 mcg increments at 4- to 6-week intervals. (**Note:** Many clinicians prefer to adjust at 6- to 8-week intervals.)

Note: Elderly patients may require <1 mcg/kg/day

I.M., I.V.: 50% of the oral dose

Myxedema coma: I.V.: Refer to adult dosing; lower doses may be needed

Dosing: PediatricDoses should be adjusted based on clinical response and laboratory parameters.

Hypothyroidism:

Oral:

Newborns: Initial: 10-15 mcg/kg/day. Lower doses of 25 mcg/day should be considered in newborns at risk for cardiac failure. Newborns with T_4 levels <5 mcg/dL should be started at 50 mcg/day. Adjust dose at 4- to 6-week intervals.

Infants and Children: Dose based on body weight and age as listed below. Children with severe or chronic hypothyroidism should be started at 25 mcg/day; adjust dose by 25 mcg every 2-4 weeks. In older children, hyperactivity may be decreased by starting with $^{1}/_{4}$ of the recommended dose and increasing by $^{1}/_{4}$ dose each week until the full replacement dose is reached. Refer to adult dosing once growth and puberty are complete.

0-3 months: 10-15 mcg/kg/day

3-6 months: 8-10 mcg/kg/day

6-12 months: 6-8 mcg/kg/day

1-5 years: 5-6 mcg/kg/day

6-12 years: 4-5 mcg/kg/day

>12 years: 2-3 mcg/kg/day

I.M., I.V.: 50% of the oral dose

Administration: I.V.Dilute vial with 5 mL normal saline; use immediately after reconstitution; do not mix with other IV fluids

Administration: I.V. DetailDilute vial with 5 mL normal saline. Use immediately after reconstitution. I.V. form must be prepared immediately prior to administration. Should not be admixed with other solutions.

Administration: OralAdminister in the morning on an empty stomach, at least 30 minutes before food. Tablets may be crushed and suspended in 1-2 teaspoonfuls of water; suspension should be used immediately. Levoxyl® should be administered with a full glass of water to prevent gagging (due to tablet swelling).

Dietary ConsiderationsShould be taken on an empty stomach, at least 30 minutes before food.

StorageStore tablets and injection at room temperature of 15°C to 30°C (59°F to 86°F). Protect tablets from light and moisture.

ReconstitutionDilute vial for injection with 5 mL normal saline. Reconstituted concentrations for the 200 mcg and 500 mcg vials are 40 mcg/mL and 100 mcg/mL, respectively. Shake well and use immediately after reconstitution; discard any unused portions.

CompatibilityDo not mix I.V. solution with other I.V. infusion solutions.

ContraindicationsHypersensitivity to levothyroxine sodium or any component of the formulation; recent MI or thyrotoxicosis; uncorrected adrenal insufficiency

Allergy Considerations

- Levothyroxine Allergy

Warnings/Precautions

Boxed warnings:

- Weight reduction: See "Other warnings/precautions" below.

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency; symptoms may be exaggerated or aggravated.
- Cardiovascular disease: Use with caution and reduce dosage in patients with angina pectoris or other cardiovascular disease; chronic hypothyroidism predisposes patients to coronary artery disease.
- Diabetes: Use with caution in patients with diabetes mellitus and insipidus; symptoms may be exaggerated or aggravated.
- Myxedema: Use with caution in patients with myxedema; symptoms may be exaggerated or aggravated.
- Osteoporosis: Long-term therapy can decrease bone mineral density. Postmenopausal women and women using suppressive doses should receive the lowest dose necessary for clinical response.

Special populations:

- Elderly: Use with caution; may be more likely to have compromised cardiovascular function; decrease initial dose.

Dosage form specific issues:

- Levoxyl®: Product may rapidly swell and disintegrate causing choking or gagging (should be administered with a full glass of water); use caution in patients with dysphagia or other swallowing disorders.

Other warnings/precautions:

- Weight reduction: **[U.S. Boxed Warning]: Thyroid supplements are ineffective and potentially toxic for weight reduction. High doses may produce serious or even life-threatening toxic effects particularly when used with some anorectic drugs.**

Geriatric ConsiderationsElderly do not have a change in serum thyroxine associated with aging; however, plasma T_3 concentrations are decreased 25% to 40% in the elderly. There is not a compensatory rise in thyrotropin suggesting that lower T_3 is not reacted upon as a deficiency by the pituitary. This indicates a slightly lower than normal dosage of thyroid hormone replacement is usually sufficient in elderly patients than in younger adult patients. TSH must be monitored since insufficient thyroid replacement (elevated TSH) is a risk for coronary artery disease and excessive replacement (low TSH) may cause signs of hyperthyroidism and excessive bone loss. Some clinicians suggest levothyroxine is the drug of choice for replacement therapy.

Pregnancy Risk FactorA

Pregnancy ConsiderationsUntreated maternal hypothyroidism may have adverse effects on fetal growth and development and is associated with higher rate of complications (spontaneous abortion, pre-eclampsia, stillbirth, premature delivery). Treatment should not be discontinued during pregnancy. TSH levels should be monitored during each trimester and 6-8 weeks postpartum. Increased doses may be needed during pregnancy.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsMinimally excreted in human milk; adequate levels are needed to maintain normal lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Angina, arrhythmia, blood pressure increased, cardiac arrest, flushing, heart failure, MI, palpitation, pulse increased, tachycardia

Central nervous system: Anxiety, emotional lability, fatigue, fever, headache, hyperactivity, insomnia, irritability, nervousness, pseudotumor cerebri (children), seizure (rare)

Dermatologic: Alopecia

Endocrine & metabolic: Fertility impaired, menstrual irregularities

Gastrointestinal: Abdominal cramps, appetite increased, diarrhea, vomiting, weight loss

Hepatic: Liver function tests increased

Neuromuscular & skeletal: Bone mineral density decreased, muscle weakness, tremor, slipped capital femoral epiphysis (children)

Respiratory: Dyspnea

Miscellaneous: Diaphoresis, heat intolerance, hypersensitivity (to inactive ingredients, symptoms include urticaria, pruritus, rash, flushing, angioedema, GI symptoms, fever, arthralgia, serum sickness, wheezing)

Levoxyl®: Choking, dysphagia, gagging

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Thyroid Products. *Risk C: Monitor therapy*

CarBAMazepine: May decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Estrogen Derivatives: May diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Ferrous Sulfate: May decrease the serum concentration of Levothyroxine. *Risk D: Consider therapy modification*

Orlistat: May decrease the serum concentration of Levothyroxine. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Thyroid Products. Phenytoin may also displace thyroid hormones from protein binding sites. *Risk C: Monitor therapy*

Raloxifene: May decrease the absorption of Levothyroxine. *Risk D: Consider therapy modification*

Rifampin: May decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Sodium Iodide I131: Thyroid Products may diminish the therapeutic effect of Sodium Iodide I131. *Risk X: Avoid combination*

Sucralfate: May decrease the serum concentration of Levothyroxine. *Risk C: Monitor therapy*

Theophylline Derivatives: Thyroid Products may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Thyroid Products may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Taking levothyroxine with enteral nutrition may cause reduced bioavailability and may lower serum thyroxine levels leading to signs or symptoms of hypothyroidism. Soybean flour (infant formula), cottonseed meal, walnuts, and dietary fiber may decrease absorption of levothyroxine from the GI tract.

Test InteractionsMany drugs may have effects on thyroid function tests (see Additional Information or Pharmacotherapy Pearls). Pregnancy, infectious hepatitis, and acute intermittent porphyria may increase TBG concentrations; nephrosis, severe hypoproteinemia, severe liver disease, and acromegaly may decrease TBG concentrations.

Monitoring ParametersThyroid function test (serum thyroxine, thyrotropin concentrations), resin triiodothyronine uptake (rT_3U), free thyroxine index (FTI), T_4, TSH, heart rate, blood pressure, clinical signs of hypo- and hyperthyroidism; TSH is the most reliable guide for evaluating adequacy of thyroid replacement dosage. TSH may be elevated during the first few months of thyroid replacement despite patients being clinically euthyroid. In cases where T_4 remains low and TSH is within normal limits, an evaluation of "free" (unbound) T_4 is needed to evaluate further increase in dosage

Infants: Monitor closely for cardiac overload, arrhythmias, and aspiration from avid suckling

Infants/children: Monitor closely for under/overtreatment. Undertreatment may decrease intellectual development and linear growth, and lead to poor school performance due to impaired concentration and slowed mentation. Overtreatment may adversely affect brain maturation, accelerate bone age (leading to premature closure of the epiphyses and reduced adult height); craniosynostosis has been reported in infants. Treated children may experience a period of catch-up growth. Monitor TSH and total or free T_4 at 2 and 4 weeks after starting treatment; every 1-2 months for first year of life; every 2-3 months during years 1-3; every 3-12 months until growth completed.

Adults: Monitor TSH every 6-8 weeks until normalized; 8-12 weeks after dosage changes; every 6-12 months throughout therapy

Reference RangePediatrics: Cord T_4 and values in the first few weeks are much higher, falling over the first months and years. ≥10 years: ~5.8-11 mcg/dL (SI: 75-142 nmol/L). Borderline low: ≤4.5-5.7 mcg/dL (SI: 58-73 nmol/L); low: ≤4.4 mcg/dL (SI: 57 nmol/L); results <2.5 mcg/dL (SI: <32 nmol/L) are strong evidence for hypothyroidism.

Approximate adult normal range: 4-12 mcg/dL (SI: 51-154 nmol/L). Borderline high: 11.1-13 mcg/dL (SI: 143-167 nmol/L); high: ≥13.1 mcg/dL (SI: 169 nmol/L). Normal range is increased in women on birth control pills (5.5-12 mcg/dL); normal range in pregnancy: ~5.5-16 mcg/dL (SI: ~71-206 nmol/L). TSH: 0.4-10 (for those ≥80 years) mIU/L; T_4: 4-12 mcg/dL (SI: 51-154 nmol/L); T_3 (RIA) (total T_3): 80-230 ng/dL (SI: 1.2-3.5 nmol/L); T_4 free (free T_4): 0.7-1.8 ng/dL (SI: 9-23 pmol/L).

Nursing: Physical Assessment/MonitoringUse with caution in presence of cardiovascular disease, adrenal insufficiency, diabetes mellitus. Assess potential for interactions with other pharmacological agents patient may be taking (eg, toxic effects with some anorectic drugs, decreased effect of oral hypoglycemics, decreased or increased effect of levothyroxine). Assess results of laboratory tests, therapeutic benefits, and adverse effects on a regular basis during therapy (eg, hypo-/hyperthyroidism). **Important:** Many drugs may have effects on thyroid function tests and results of laboratory tests. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsThyroid function (serum thyroxine, thyrotropin concentrations), resin triiodothyronine uptake (rT_3U), free thyroxine index (FTI), T_4, TSH, TSH may be elevated during the first few months of thyroid replacement despite patients being clinically euthyroid. In cases where T_4 remains low and TSH is within normal limits, an evaluation of "free" (unbound) T_4 is needed to evaluate further increase in dosage.

Patient EducationConsult prescriber before taking new medication or herbal products during therapy; some other medications or herbals may cause adverse effects with levothyroxine. Thyroid replacement therapy is generally for life. Take as directed, in the morning 30 minutes before breakfast. Do not take antacids or iron preparations within 8 hours of thyroid medication. Do not change brands and do not discontinue without consulting prescriber. Report chest pain, rapid heart rate, palpitations, heat intolerance, excessive sweating, increased nervousness, agitation, or lethargy.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium: 0.2 mg, 0.5 mg

Tablet, as sodium: 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg

Levothroid®: 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg

Levoxyl®: 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg

Synthroid®: 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg

Unithroid®: 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg

200 mcg (30): $21.99

Mechanism of ActionExact mechanism of action is unknown; however, it is believed the thyroid hormone exerts its many metabolic effects through control of DNA transcription and protein synthesis; involved in normal metabolism, growth, and development; promotes gluconeogenesis, increases utilization and mobilization of glycogen stores, and stimulates protein synthesis, increases basal metabolic rate

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: Oral: 3-5 days; I.V. 6-8 hours

Peak effect: I.V.: 24 hours

Absorption: Oral: Erratic (40% to 80%); may be decreased by age and specific foods and drugs

Protein binding: >99%

Metabolism: Hepatic to triiodothyronine (active)

Time to peak, serum: 2-4 hours

Half-life elimination: Euthyroid: 6-7 days; Hypothyroid: 9-10 days; Hyperthyroid: 3-4 days

Excretion: Urine and feces; decreases with age

Pharmacotherapy PearlsEquivalent doses: The following statement on relative potency of thyroid products is included in a joint statement by American Thyroid Association (ATA), American Association of Clinical Endocrinologists (AACE) and The Endocrine Society (TES): For purposes of conversion, levothyroxine sodium (T_4) 100 mcg is usually considered equivalent to desiccated thyroid 60 mg, thyroglobulin 60 mg, or liothyronine sodium (T_3) 25 mcg. However, these are rough guidelines only and do not obviate the careful re-evaluation of a patient when switching thyroid hormone preparations, including a change from one brand of levothyroxine to another. Joint position statement is available at http://www.thyroid.org/professionals/advocacy/04_12_08_thyroxine.html.

Note: Several medications have effects on thyroid production or conversion. The impact in thyroid replacement has not been specifically evaluated, but patient response should be monitored:

Methimazole: Decreases thyroid hormone secretion, while propylthiouracil decrease thyroid hormone secretion and decreases conversion of T_4 to T_3.

Beta-adrenergic antagonists: Decrease conversion of T_4 to T_3 (dose related, propranolol ≥160 mg/day); patients may be clinically euthyroid.

Iodide, iodine-containing radiographic contrast agents may decrease thyroid hormone secretion; may also increase thyroid hormone secretion, especially in patients with Graves' disease.

Other agents reported to impact on thyroid production/conversion include aminoglutethimide, amiodarone, chloral hydrate, diazepam, ethionamide, interferon-alpha, interleukin-2, lithium, lovastatin (case report), glucocorticoids (dose-related), mercaptopurine, sulfonamides, thiazide diuretics, and tolbutamide.

In addition, a number of medications have been noted to cause transient depression in TSH secretion, which may complicate interpretation of monitoring tests for levothyroxine, including corticosteroids, octreotide, and dopamine. Metoclopramide may increase TSH secretion

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo precautions with vasoconstrictor are necessary if patient is well controlled with levothyroxine

Mental Health: Effects on Mental StatusMay rarely cause nervousness or insomnia

Mental Health: Effects on Psychiatric TreatmentUsed to augment antidepressants; TCAs may increase toxic potential of both drugs

Cardiovascular ConsiderationsThe treatment of patients with combined hypothyroidism and ischemic heart disease needs to be approached very carefully, preferably under the guidance of an endocrinologist and cardiologist. This is because administration of substantial doses of thyroid hormone may precipitate acute cardiac ischemia in patients who have been chronically hypothyroid. Therefore, recognizing that dosing regimens may vary, the general approach is to start at very low doses of thyroid supplementation with very gradual increases in dosage every 3-6 weeks. It is important that patients be monitored very carefully for development of cardiac ischemia during thyroid hormone supplementation. Similarly, patients with heart failure and hypothyroidism should be closely followed.

The possibility of underlying hypothyroidism (and also hyperthyroidism) should be considered in patients with atrial fibrillation. Correction of the underlying thyroid disorder may help in restoration of normal sinus rhythm. Hypothyroidism may also constitute an underlying etiology for obstructive sleep apnea.

Anesthesia and Critical Care Concerns/Other ConsiderationsEquivalent doses: The following statement on relative potency of thyroid products is included in a joint statement by American Thyroid Association (ATA), American Association of Clinical Endocrinologists (AACE), and The Endocrine Society (TES): For purposes of conversion, levothyroxine sodium (T_4) 100 mcg is usually considered equivalent to desiccated thyroid 60 mg, thyroglobulin 60 mg, or liothyronine sodium (T_3) 25 mcg. However, these are rough guidelines only and do not obviate the careful re-evaluation of a patient when switching thyroid hormone preparations, including a change from one brand of levothyroxine to another. Joint position statement is available at http://www.thyroid.org/professionals/advocacy/04_12_08_thyroxine.html.

Note: Several medications have effects on thyroid production or conversion. The impact in thyroid replacement has not been specifically evaluated, but patient response should be monitored:

- Methimazole: Decreases thyroid hormone secretion, while propylthiouracil decrease thyroid hormone secretion and decreases conversion of T_4 to T_3.
- Beta-adrenergic antagonists: Decrease conversion of T_4 to T_3 (dose related, propranolol ≥160 mg/day); patients may be clinically euthyroid.
- Iodide, iodine-containing radiographic contrast agents may decrease thyroid hormone secretion; may also increase thyroid hormone secretion, especially in patients with Graves' disease.

Other agents reported to impact on thyroid production/conversion include aminoglutethimide, amiodarone, chloral hydrate, diazepam, ethionamide, interferon-alpha, interleukin-2, lithium, lovastatin (case report), glucocorticoids (dose-related), mercaptopurine, sulfonamides, thiazide diuretics, and tolbutamide.

In addition, a number of medications have been noted to cause transient depression in TSH secretion, which may complicate interpretation of monitoring tests for levothyroxine, including corticosteroids, octreotide, and dopamine. Metoclopramide may increase TSH secretion

Soy protein may interfere with absorption of levothyroxine sodium. An enteral formula without soy protein should be selected and thyroid function monitored during tube feeding.

Index Terms *L*-Thyroxine Sodium; Levothyroxine Sodium; T_4

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsLocal or regional anesthesia in ophthalmologic surgery by peripheral nerve block techniques such as peribulbar, retrobulbar, and facial blocks; may be used with or without epinephrine

Dosing: Adults**Note:** Use lowest effective dose to limit toxic effects. Dosing based on lidocaine 1% and bupivacaine 0.375%

Retrobulbar injection: 2-5 mL; a portion of dose is injected retrobulbarly and remainder may be used to block the facial nerve

Peribulbar block: 6-12 mL

Maximum dose: 0.18 mL/kg or 12 mL; if used with epinephrine, the dose should not exceed 0.28 mL/kg or 20 mL

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Use lowest effective dose to limit toxic effects. Dosing based on lidocaine 1% and bupivacaine 0.375%

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentLidocaine: Accumulation of metabolites may increase with renal impairment

Dosing: Hepatic Impairment

Lidocaine: Half-life of lidocaine is increased twofold with hepatic impairment

Bupivacaine: Toxicities may be increased with hepatic impairment

StorageStore at 15°C to 25°C (59°F to 77°F).

ContraindicationsHypersensitivity to lidocaine, bupivacaine, amide-type local anesthetics (etidocaine, mepivacaine, prilocaine, ropivacaine) or any component of the formulation; Stokes-Adams syndrome; Wolff-Parkinson-White syndrome; severe degrees of sinoatrial, atrioventricular, or intraventricular block without artificial pacemaker

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.
- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest, especially when administered near the head or neck.
- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection or administration near the head or neck.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with shock, heart block without functional pacemakers, or cardiac dysfunction.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Acutely ill patients: Use with caution in acutely ill patients.
- Debilitated patients: Use with caution in debilitated patients.
- Elderly: Use with caution in the elderly.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.

- Repeated doses: May lead to significant increases in blood levels due to accumulation of drug and metabolites.
- Spinal anesthesia: Use not intended for spinal anesthesia.
- Trained personnel: Clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies with lidocaine have not shown teratogenic effects. Lidocaine and bupivacaine cross the placenta; effects to the fetus may depend on procedure performed. Use during pregnancy only if the potential benefit to the mother outweighs any potential risk to the fetus.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsBupivacaine and lidocaine are both excreted in human milk. The American Academy of Pediatrics considers lidocaine to be “compatible” with breast-feeding.

Adverse ReactionsFrequency not defined; reactions may be dose related or due to unintentional intravascular injection.

Cardiovascular: Bradycardia, cardiac arrest, cardiac output decreased, heart block, hypotension, myocardium depression, ventricular arrhythmia

Central nervous system: Anxiety, chills, convulsions, depression, dizziness, drowsiness, excitation, restlessness

Gastrointestinal: Nausea, vomiting

Neuromuscular & skeletal: Tremors

Ocular: Blurred vision, pupil constriction, permanent injury to extraocular muscle

Otic: Tinnitus

Respiratory: Respiratory arrest

Miscellaneous: Allergic reaction

Following unintentional subarachnoid injection: Backache, cranial nerve palsies, headache, incontinence (fecal or urinary), meningismus, paralysis, paresthesia, perineal sensation loss, persistent anesthesia, septic meningitis, sexual function loss, spinal block, urinary retention, weakness

Metabolism/Transport EffectsLidocaine: **Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP1A2 (strong), 2D6 (moderate), 3A4 (moderate)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: Lidocaine hydrochloride 1% and bupivacaine hydrochloride 0.375% (10 mL)

Generic AvailableNo

ManufacturerAmphastar Pharmaceuticals, Inc

Mechanism of ActionBlocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction.

Pharmacodynamics/KineticsAlso see individual agents.

Protein binding: Lidocaine: Fraction bound decreases with increased concentration; also dependent upon plasma concentration of alpha$_1$-acid glycoprotein

Metabolism: Lidocaine: Hepatic, forms metabolites; Bupivacaine: hepatic, forms metabolites

Half-life elimination: Lidocaine: I.V.: 1.5-2 hours; Bupivacaine: I.V.: 2.7 hours

Time to peak, plasma: Following peribulbar block: Lidocaine: 20 minutes; Bupivacaine: 21 minutes

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, depression, dizziness, drowsiness, excitation, or restlessness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsBupivacaine and Lidocaine; Lidocaine Hydrochloride and Bupivacaine Hydrochloride

Medication Safety Issues

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(LYE doe kane & ep i NEF rin)

U.S. Brand NamesLidoSite™; Lignospan® Forte; Lignospan® Standard; Xylocaine® MPF With Epinephrine; Xylocaine® With Epinephrine

Canadian Brand NamesXylocaine® With Epinephrine

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsLocal infiltration anesthesia; AVS for nerve block; topical local analgesia for superficial dermatologic procedures

Use: DentalAmide-type anesthetic used for local infiltration anesthesia injection near nerve trunks to produce nerve block

Dosing: AdultsDosage varies with the anesthetic procedure, degree of anesthesia needed, vascularity of tissue, duration of anesthesia required, and physical condition of patient.

Dental anesthesia, infiltration, or conduction block:

Children <10 years: 20-30 mg (1-1.5 mL) of lidocaine hydrochloride as a 2% solution with epinephrine 1:100,000; maximum: 4-5 mg of lidocaine hydrochloride/kg of body weight or 100-150 mg as a single dose

Children >10 years and Adults: Do not exceed 6.6 mg/kg body weight or 300 mg of lidocaine hydrochloride and 3 mcg (0.003 mg) of epinephrine/kg of body weight or 0.2 mg epinephrine per dental appointment. The effective anesthetic dose varies with procedure, intensity of anesthesia needed, duration of anesthesia required, and physical condition of the patient. Always use the lowest effective dose along with careful aspiration.

For most routine dental procedures, lidocaine hydrochloride 2% with epinephrine 1:100,000 is preferred. When a more pronounced hemostasis is required, a 1:50,000 epinephrine concentration should be used.

Dermatologic procedure: Topical: Place 1 transdermal patch over area requiring analgesia; attach patch to iontophoretic controller and leave on for 10 minutes. Remove patch and perform procedure within 10-20 minutes of patch removal. Do not use another patch for 30 minutes.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricLocal anesthetic:

Infiltration: Use lidocaine concentrations of 0.5% to 1% (or even more diluted) to decrease possibility of toxicity. Lidocaine dose should not exceed 7 mg/kg/dose; do not repeat within 2 hours.

Dermatologic procedure: Topical: Children ≥5 years: Refer to adult dosing.

Administration: Other

Injection solution for infiltration: Before injecting, withdraw syringe plunger to ensure injection is not into vein or artery. Aspirate the syringe after tissue penetration and before injection to minimize chance of direct vascular injection.

Transdermal system: Use on normal intact skin. Avoid use on hair-covered skin: adherence may not be adequate. Do not use disinfecting agents containing heavy metal ions (eg, mercury, zinc, copper); they are associated with increased swelling and edema. Before application, wipe area with alcohol. After skin is dry, position circular reservoir on the area to be treated. Apply light pressure from the center of the circular reservoir outward to the edges. Repeat for the oblong reservoir. Connect the controller and turn on for 10 minutes. Consult controller instructions for further details. If controller flashes yellow light (4 times/sec) medication may not have been delivered to application site; may be caused by higher than normal skin resistance, and not a malfunction of patch or controller. A tactile check of the application site may determine subjectively the level of anesthetic effect. Restrict motion of application site. A second application using a new patch may be applied after 30 minutes to a different skin site. Do not reapply to same skin site.

StorageSolutions with epinephrine should be protected from light. Transdermal system (LidoSite™) should be stored at 20°C to 25°C (68°F to 77°F); do not freeze.

ContraindicationsHypersensitivity to lidocaine, epinephrine, or any component of the formulation; hypersensitivity to other local anesthetics of the amide type; myasthenia gravis; shock; cardiac conduction disease; angle-closure glaucoma

LidoSite™: Hypersensitivity to lidocaine, epinephrine, other local anesthetics of the amide type, or any component of the formulation; patients with electrically-sensitive devices (eg, pacemakers, implantable defibrillators)

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS toxicity: Careful and constant monitoring of the patient's state of consciousness should be done following each local anesthetic injection; at such times, restlessness, anxiety, tinnitus, dizziness, blurred vision, tremors, depression, or drowsiness may be early warning signs of CNS toxicity. Treatment is primarily symptomatic and supportive.

- Respiratory arrest: Local anesthetics have been associated with rare occurrences of sudden respiratory arrest.

- Seizures: Convulsions due to systemic toxicity leading to cardiac arrest have also been reported, presumably following unintentional intravascular injection.

Disease-related concerns:

- Cardiovascular disease: Use minimal amounts in patients with significant cardiovascular problems (because of epinephrine component).

- Endocrine disease: Use with caution in patients with endocrine disease.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Thyroid disease: Use with caution in patients with thyroid disease; avoid in patients with uncontrolled hyperthyroidism.

Concurrent drug therapy issues:

- Flammable anesthetics: Avoid use in presence of flammable anesthetics.

Special populations:

- Acutely ill patients: Use with caution in acutely ill; reduce dose consistent with age and physical status.

- Debilitated patients: Use with caution in debilitated patients; reduce dose consistent with age and physical status.

- Elderly: Use with caution in the elderly; reduce dose consistent with age and physical status.

- Pediatrics: Use with caution in children; reduce dose consistent with age and physical status.

Dosage form specific issues:

- Injection: Aspirate the syringe (injection solution for infiltration formulation) after tissue penetration and before injection to minimize chance of direct vascular injection.

- LidoSite™: Do not use near flammable anesthetics. Use with caution in patients with peripheral vascular disease; may have exaggerated vasoconstriction. Use with caution in patients with severe coronary artery disease, hypertension, cardiac dysrhythmias, or patients taking MAO inhibitors or tricyclic antidepressants. Use caution in patients with skin susceptible to injury.

- Sodium metabisulfite: May contain sodium metabisulfite; use caution in patients with a sulfite allergy.

- Topical formulation: Avoid application of topical formulation to distal portions of body (eg, digits, nose, ears, penis).

- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI.

Other warnings/precautions:

- Administration: Intravascular injections should be avoided; aspiration should be performed prior to administration; the needle must be repositioned until no return of blood can be elicited by aspiration; however, absence of blood in the syringe does not guarantee that intravascular injection has been avoided.

- Trained personnel: Dental practitioners and/or clinicians using local anesthetic agents should be well trained in diagnosis and management of emergencies that may arise from the use of these agents. Resuscitative equipment, oxygen, and other resuscitative drugs should be available for immediate use.

Pregnancy Risk FactorB
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/compatible
Breast-Feeding ConsiderationsUsual infiltration doses of lidocaine with epinephrine given to nursing mothers has not been shown to affect the health of the nursing infant.
Adverse ReactionsDegree of adverse effects in the central nervous system and cardiovascular system are directly related to the blood levels of lidocaine. The effects below are more likely to occur after systemic administration rather than infiltration.

Cardiovascular: Myocardial effects include a decrease in contraction force as well as a decrease in electrical excitability and myocardial conduction rate resulting in bradycardia and reduction in cardiac output.

Central nervous system: High blood levels result in anxiety, restlessness, disorientation, confusion, dizziness, tremor, and seizure. This is followed by depression of CNS resulting in somnolence, unconsciousness and possible respiratory arrest. In some cases, symptoms of CNS stimulation may be absent and the primary CNS effects are somnolence and unconsciousness.

Gastrointestinal: Nausea and vomiting may occur

Hypersensitivity reactions: Extremely rare, but may be manifest as dermatologic reactions and edema at injection site. Asthmatic syndromes have occurred. Patients may exhibit hypersensitivity to bisulfites contained in local anesthetic solution to prevent oxidation of epinephrine. In general, patients reacting to bisulfites have a history of asthma and their airways are hyper-reactive to asthmatic syndrome.

Psychogenic reactions: It is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injections are perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitation, hyperventilation, generalized pallor and a fainting feeling

Topical formulation:

>10%: Dermatologic: Papules (up to 12%)

1% to 10%: Dermatologic: Burns (up to 8%), rash (5%), skin irritation, burning sensation, blanching

<1%: Erythema, hematoma, urticaria

Metabolism/Transport EffectsLidocaine: **Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP1A2 (strong), 2D6 (strong), 3A4 (moderate)

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Inhalational Anesthetics: May enhance the arrhythmogenic effect of EPINEPHrine. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

0.5% / 1:200,000: Lidocaine hydrochloride 0.5% and epinephrine 1:200,000 (50 mL)

1% / 1:100,000: Lidocaine hydrochloride 1% and epinephrine 1:100,000 (20 mL, 30 mL, 50 mL)

1% / 1:200,000: Lidocaine hydrochloride 1% and epinephrine 1:200,000 (30 mL)

1.5% / 1:200,000: Lidocaine hydrochloride 1.5% and epinephrine 1:200,000 (30 mL)

2% / 1:50,000: Lidocaine hydrochloride 2% and epinephrine 1:50,000 (1.8 mL)

2% / 1:100,000: Lidocaine hydrochloride 2% and epinephrine 1:100,000 (1.8 mL, 30 mL, 50 mL)

2% / 1:200,000: Lidocaine hydrochloride 2% and epinephrine 1:200,000 (20 mL)

Lignospan® Forte: 2% / 1:50,000: Lidocaine hydrochloride 2% and epinephrine 1:50,000 (1.7 mL) [contains edetate disodium, potassium metabisulfite]

Lignospan® Standard: 2% / 1:100,000: Lidocaine hydrochloride 2% and epinephrine 1:100,000 (1.7 mL) [contains edetate disodium, potassium metabisulfite]

Xylocaine® with Epinephrine:

0.5% / 1:200,000: Lidocaine hydrochloride 0.5% and epinephrine 1:200,000 (50 mL) [contains methylparaben]

1% / 1:100,000: Lidocaine hydrochloride 1% and epinephrine 1:100,000 (10 mL, 20 mL, 50 mL) [contains methylparaben]

2% / 1:50,000: Lidocaine hydrochloride 2% and epinephrine 1:50,000 (1.8 mL) [contains sodium metabisulfite]

2% / 1:100,000: Lidocaine hydrochloride 2% and epinephrine 1:100,000 (1.8 mL) [contains sodium metabisulfite]; (10 mL, 20 mL, 50 mL)

[contains methylparaben]

Xylocaine®-MPF with Epinephrine:

1% / 1:200,000: Lidocaine hydrochloride 1% and epinephrine 1:200,000 (5 mL, 10 mL, 30 mL) [contains sodium metabisulfite]

1.5% / 1:200,000: Lidocaine hydrochloride 1.5% and epinephrine 1:200,000 (5 mL, 10 mL, 30 mL) [contains sodium metabisulfite]

2% / 1:200,000: Lidocaine hydrochloride 2% and epinephrine 1:200,000 (5 mL, 10 mL, 20 mL) [contains sodium metabisulfite]

Transdermal system (LidoSite™): Lidocaine hydrochloride 10% and epinephrine 0.1% (25s) [contains sodium metabisulfite; for use only with LidoSite™ controller]

Generic AvailableYes: Excludes transdermal system

Mechanism of ActionLidocaine blocks both the initiation and conduction of nerve impulses via decreased permeability of sodium ions; epinephrine increases the duration of action of lidocaine by causing vasoconstriction (via alpha effects) which slows the vascular absorption of lidocaine

Pharmacodynamics/Kinetics

Onset of action: Peak effect: ~5 minutes

Duration: ~2 hours; dose and anesthetic procedure dependent

Absorption: Topical: Lidocaine: Minimal; Epinephrine: Minimal

See individual agents.

- Lidocaine

Dental Health: Effects on Dental TreatmentIt is common to misinterpret psychogenic responses to local anesthetic injection as an allergic reaction. Intraoral injections are perceived by many patients as a stressful procedure in dentistry. Common symptoms to this stress are diaphoresis, palpitations, hyperventilation. Patients may exhibit hypersensitivity to bisulfites contained in local anesthetic solution to prevent oxidation of epinephrine. In general, patients reacting to bisulfites have a history of asthma and their airways are hyper-reactive to asthmatic syndrome.

Degree of adverse effects in the CNS and cardiovascular system is directly related to the blood levels of lidocaine: Bradycardia, hypersensitivity reactions (rare; may be manifest as dermatologic reactions and edema at injection site), asthmatic syndromes

High blood levels: Anxiety, restlessness, disorientation, confusion, dizziness, tremors, seizures, CNS depression (resulting in somnolence, unconsciousness and possible respiratory arrest), nausea, and vomiting.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHigh blood levels may cause anxiety, confusion, dizziness, disorientation, restlessness, and somnolence.

Mental Health: Effects on Psychiatric TreatmentConcomitant use with propranolol and TCAs may result in an increase in blood pressure.

Cardiovascular ConsiderationsSympathomimetic or sympathomimetic-containing combination products may increase blood pressure. These preparations are relatively contraindicated in patients with significant hypertension, particularly in poorly controlled hypertension. In young, healthy patients presenting with new onset blood pressure elevations, it is important to exclude the recent use of sympathomimetics as a cause for the blood pressure elevation.

Pharmacologic CategoryAnesthetic/Corticosteroid

Use: Labeled IndicationsTopical anti-inflammatory and anesthetic for skin disorders; rectal for the treatment of hemorrhoids, anal fissures, pruritus ani, or similar conditions

Dosing: AdultsAnti-inflammatory/anesthetic:

Topical: Apply 2-3 times/day

Rectal: One applicatorful twice daily

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalTopical: Apply thin film to affected area; avoid use of occlusive dressings

Administration: OtherRectal: Applicator tip should be gently inserted into the anal area; apply to areas of discomfort and anal opening. Do not completely insert applicator and tube; do not insert deep in the anus or rectum.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F); do not freeze.

ContraindicationsHypersensitivity to lidocaine, hydrocortisone, local anesthetics of the amide type, corticosteroids, or any component of the formulation; topical tuberculous, viral or fungal infections

Allergy Considerations

- Corticosteroid Allergy
- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Infection: Discontinue if infection occurs.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- Class I antiarrhythmics: Use with caution in patients taking class I antiarrhythmics.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Application site: For external use only; avoid contact with eyes, nose, or ears.

Pregnancy Risk FactorB

Pregnancy ConsiderationsSee individual agents.

LactationSee individual agents.

Metabolism/Transport Effects

Lidocaine: **Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP1A2 (strong), 2D6 (strong), 3A4 (moderate)

Hydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Cream, rectal:

AnaMantle HC® Forte: Lidocaine hydrochloride 3% and hydrocortisone acetate 1% (7 g) [kit contains 20 tubes (7 g each), 20 single-use applicators, and 20 single-use wipes]

AnaMantle® HC: Lidocaine hydrochloride 3% and hydrocortisone acetate 0.5% (7 g) [kit contains 14 single-use tubes (7 g each) and 14 applicators]

Peranex™ HC: Lidocaine hydrochloride 2% and hydrocortisone acetate 2% (7 g) [kit contains 24 single-use tubes with built-in applicators (7 g each) and 24 cleansing wipes]

Rectacreme HC: Lidocaine hydrochloride 3% and hydrocortisone acetate 0.5% (7 g) [kit contains 20 single-use tubes with applicators (7 g each) and cleansing towlette]

Xyralid™ RC: Lidocaine hydrochloride 3% and hydrocortisone acetate 1% (7 g) [packaged with 7 Konsyl® psyllium packets]

Cream, topical: Lidocaine hydrochloride 3% and hydrocortisone acetate 0.5% (30 g)

Lida-Mantle® HC: Lidocaine hydrochloride 3% and hydrocortisone acetate 0.5% (30 g, 85 g)

Xyralid™: Lidocaine hydrochloride 3% and hydrocortisone acetate 1% (85 g)

Gel, rectal:

AnaMantle HC®: Lidocaine hydrochloride 3% and hydrocortisone acetate 2.5% (7 g) [kit contains 20 single-use tubes with applicators (7 g each) and 20 cleansing wipes]

RectaGel™ HC: Lidocaine hydrochloride 2.8% and hydrocortisone acetate 0.55% (20 g) [kit contains 5 tubes (20 g each) and 15 single-use applicators]

Lotion, topical: Lidocaine hydrochloride 3% and hydrocortisone acetate 0.5% (177 mL)

Lida-Mantle® HC, Senatec HC [DSC], Xyralid™ LP: Lidocaine hydrochloride 3% and hydrocortisone acetate 0.5% (177 mL)

Pad, topical:

Peranex™ HC Medi-Pad: Lidocaine hydrochloride 3% and hydrocortisone acetate 1% (60s) [6 mL solution/pad]

Generic AvailableYes: Excludes gel
Pricing: U.S. (www.drugstore.com)

Cream (AnaMantle HC)

Topical Anesthetic Use for Cosmetic or Medical Procedures: Public Health Advisory - January 2009

The Food and Drug Administration (FDA) is issuing a Public Health Advisory to remind consumers, caregivers, and healthcare professionals of potential life-threatening side effects associated with the use of topical anesthetics available as prescription and over-the-counter (OTC) products for a variety of uses, including numbing skin prior to cosmetic or medical procedures (topical lidocaine has been recently evaluated to relieve mammography discomfort). Topical application can result in high systemic levels and lead to toxic effects (eg, irregular heart beats, seizures, coma, respiratory depression, death). At risk are consumers, particularly without the supervision of trained professionals, who apply large amounts of anesthetics (or cover large areas of the skin), leave these products on for long periods of time, or use materials, wraps, or dressings to cover the skin after anesthetic application. The FDA is working with healthcare professional organizations and other media to spread the message about the potential hazards and safe use of topical anesthetics. The FDA is recommending that if topical anesthetics are needed prior to procedures, consumers ask their healthcare provider for instructions on safe use of these products, use only FDA-approved products, and use products with the lowest amount of anesthetic while applying the least amount possible to relieve pain. If a high degree of pain is expected that is not controlled by appropriate amounts of topical anesthetics, consumers should ask their physician for alternatives techniques for pain control.

Additional information can be found at http://www.fda.gov/medwatch/safety/2009/safety09.htm#Anesthetics

Pronunciation(LYE doe kane & PRIL oh kane)

U.S. Brand NamesEMLA®; Oraquix®

Canadian Brand NamesEMLA®

Pharmacologic CategoryLocal Anesthetic

Use: Labeled IndicationsTopical anesthetic for use on normal intact skin to provide local analgesia for minor procedures such as I.V. cannulation or venipuncture; has also been used for painful procedures such as lumbar puncture and skin graft harvesting; for superficial minor surgery of genital mucous membranes and as an adjunct for local infiltration anesthesia in genital mucous membranes.

Use: Dental

Periodontal gel (Oraqix®): Use in adults who require localized anesthesia in periodontal pockets during scaling and/or root planning.

Topical: Amide-type topical anesthetic for use on normal intact skin to provide local analgesia for minor procedures such as I.V. cannulation or venipuncture

Dosing: Adults

Anesthetic: Topical:

EMLA® cream and EMLA® anesthetic disc: A thick layer of EMLA® cream is applied to intact skin and covered with an occlusive dressing, or alternatively, an EMLA® anesthetic disc is applied to intact skin

Note: Dermal analgesia can be expected to increase for up to 3 hours under occlusive dressing and persist for 1-2 hours after removal of the cream

Minor dermal procedures (eg, I.V. cannulation or venipuncture): Topical: Apply 2.5 g of cream (1/2 of the 5 g tube) over 20-25 cm of skin surface area, or 1 anesthetic disc (1 g over 10 cm^2) for at least 1 hour. **Note:** In clinical trials, 2 sites were usually prepared in case there was a technical problem with cannulation or venipuncture at the first site.

Major dermal procedures (eg, more painful dermatological procedures involving a larger skin area such as split thickness skin graft harvesting): Topical: Apply 2 g of cream per 10 cm^2 of skin and allow to remain in contact with the skin for at least 2 hours.

Adult male genital skin (eg, pretreatment prior to local anesthetic infiltration): Apply a thick layer of cream (1 g/10 cm^2) to the skin surface for 15 minutes. Local anesthetic infiltration should be performed immediately after removal of EMLA® cream.

Adult female genital mucous membranes: Minor procedures (eg, removal of condylomata acuminata, pretreatment for local anesthetic infiltration): Apply 5-10 g (thick layer) of cream for 5-10 minutes

Periodontal gel (Oraqix®): Apply on gingival margin around selected teeth using the blunt-tipped applicator included in package. Wait 30 seconds, then fill the periodontal pockets using the blunt-tipped applicator until gel becomes visible at the gingival margin. Wait another 30 seconds before starting treatment. Maximum recommended dose: One treatment session: 5 cartridges (8.5 g)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** EMLA® should **not** be used in neonates with a gestational age <37 weeks nor in infants <12 months of age who are receiving treatment with methemoglobin-inducing agents

Local anesthetic (procedures): Topical: Children (intact skin):

Note: Dosing is based on child's age and weight: Although the incidence of systemic adverse effects with EMLA® is very low, caution should be exercised, particularly when applying over large areas and leaving on for >2 hours

Age 0-3 months or <5 kg: Apply a maximum of 1 g over no more than 10 cm^2 of skin; leave on for no longer than 1 hour.

Age 3 months to 12 months and >5 kg: Apply no more than a maximum 2 g total over no more than 20 cm^2 of skin; leave on for no longer than 4 hours.

Age 1-6 years and >10 kg: Apply no more than a maximum of 10 g total over no more than 100 cm^2 of skin; leave on for no longer than 4 hours.

Age 7-12 years and >20 kg: Apply no more than a maximum 20 g total over no more than 200 cm^2 of skin; leave on for no longer than 4 hours.

Note: If a patient greater than 3 months old does not meet the minimum weight requirement, the maximum total dose should be restricted to the corresponding maximum based on patient weight.

Dosing: Renal ImpairmentSmaller areas of treatment are recommended for patients with renal dysfunction.
Dosing: Hepatic ImpairmentSmaller areas of treatment are recommended for patients with hepatic dysfunction.
Administration: TopicalFor external use only. Avoid application to open wounds or near the eyes. In small infants and children, observe patient to prevent accidental ingestion of cream, disc, or dressing. Choose two application sites available for intravenous access. Apply a thick layer (2.5 g/site ~$^{1}/_{2}$ of a 5 g tube) of cream to each designated site of intact skin. Cover each site with the occlusive dressing (Tegaderm®). Mark the time on the dressing. **Allow at least 1 hour for optimum therapeutic effect.** Remove the dressing and wipe off excess EMLA® cream (gloves should be worn). **Smaller areas of treatment are recommended for debilitated patients.**
StorageStore at room temperature.
ContraindicationsHypersensitivity to amide-type anesthetic agents (eg, lidocaine, prilocaine, dibucaine, mepivacaine, bupivacaine, etidocaine); hypersensitivity to any component of the formulation selected; application on mucous membranes or broken or inflamed skin; infants <1 month of age if gestational age is <37 weeks; infants <12 months of age receiving therapy with methemoglobin-inducing agents; children with congenital or idiopathic methemoglobinemia, or in children who are receiving medications associated with drug-induced methemoglobinemia (eg, acetaminophen [overdosage], benzocaine, chloroquine, dapsone, nitrofurantoin, nitroglycerin, nitroprusside, phenazopyridine, phenelzine, phenobarbital, phenytoin, quinine, sulfonamides)
Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

Concurrent drug therapy issues:

- Class I and III antiarrhythmics: Use with caution in patients receiving class I and III antiarrhythmic drugs, since systemic absorption occurs and synergistic toxicity is possible.

Special populations:

- Acutely ill patients: Use with caution in acutely ill; reduce dose consistent with age and physical status.

- Debilitated patients: Use with caution in debilitated patients; reduce dose consistent with age and physical status.

- Elderly: Use with caution in the elderly; reduce dose consistent with age and physical status.

Other warnings/precautions:

- Appropriate use: Although the incidence of systemic adverse reactions with EMLA® is very low, caution should be exercised, particularly when applying over large areas and leaving on for longer than 2 hours. Avoid use on open wounds or near the eyes.

Pregnancy Risk FactorB
Pregnancy ConsiderationsRefer to Lidocaine monograph.
LactationEnters breast milk/compatible
Breast-Feeding ConsiderationsUsual infiltration doses of lidocaine and prilocaine given to nursing mothers has not been shown to affect the health of the nursing infant.
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, angioedema

Central nervous system: Shock

Dermatologic: Hyperpigmentation, erythema, itching, rash, burning, urticaria

Genitourinary: Blistering of foreskin (rare)

Local: Burning, stinging, edema

Respiratory: Bronchospasm

Miscellaneous: Alteration in temperature sensation, hypersensitivity reactions

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport EffectsLidocaine: **Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP1A2 (strong), 2D6 (strong), 3A4 (moderate)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringUse on intact skin only. Monitor for effectiveness of anesthesia and adverse reactions. Monitor for return of sensation.

Patient EducationThis drug will block sensation to the applied area. Report irritation, pain, burning at application site.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical: Lidocaine 2.5% and prilocaine 2.5% (5 g, 30 g)

EMLA®: Lidocaine 2.5% and prilocaine 2.5% (5 g, 30 g) [each packaged with Tegaderm® dressings]

Disc, topical: Lidocaine 2.5% and prilocaine 2.5% per disc (2s, 10s) [each 1 g disc is 10 cm^2]

Gel, periodontal: Lidocaine 2.5% and prilocaine 2.5% (1.7 g) [cartridge]

Generic AvailableYes: Cream

Pricing: U.S. (www.drugstore.com)

Cream (Lidocaine-Prilocaine)

2.5-2.5% (30): $41.99

Mechanism of ActionLocal anesthetic action occurs by stabilization of neuronal membranes and inhibiting the ionic fluxes required for the initiation and conduction of impulses

Pharmacodynamics/Kinetics

EMLA®:

Onset of action: 1 hour

Peak effect: 2-3 hours

Duration: 1-2 hours after removal

Absorption: Related to duration of application and area where applied

3-hour application: 3.6% lidocaine and 6.1% prilocaine

24-hour application: 16.2% lidocaine and 33.5% prilocaine

See individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Application site reactions in the oral cavity in 52/391 patients (13%) included pain, soreness, irritation, numbness, ulcerations, vesicles, edema, abscess and/or redness in the treated area. The 13% represented adverse effects occurring in more than one patient. Each patient was counted only once per adverse event. Taste perversion also reported (2%) including complaints of bad or bitter taste for up to 4 hours after administration.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentContraindicated with phenytoin, phenobarbital, and phenelzine

Index TermsPrilocaine and Lidocaine

Topical Anesthetic Use for Cosmetic or Medical Procedures: Public Health Advisory - January 2009

The Food and Drug Administration (FDA) is issuing a Public Health Advisory to remind consumers, caregivers, and healthcare professionals of potential life-threatening side effects associated with the use of topical anesthetics available as prescription and over-the-counter (OTC) products for a variety of uses, including numbing skin prior to cosmetic or medical procedures (topical lidocaine has been recently evaluated to relieve mammography discomfort). Topical application can result in high systemic levels and lead to toxic effects (eg, irregular heart beats, seizures, coma, respiratory depression, death). At risk are consumers, particularly without the supervision of trained professionals, who apply large amounts of anesthetics (or cover large areas of the skin), leave these products on for long periods of time, or use materials, wraps, or dressings to cover the skin after anesthetic application. The FDA is working with healthcare professional organizations and other media to spread the message about the potential hazards and safe use of topical anesthetics. The FDA is recommending that if topical anesthetics are needed prior to procedures, consumers ask their healthcare provider for instructions on safe use of these products, use only FDA-approved products, and use products with the lowest amount of anesthetic while applying the least amount possible to relieve pain. If a high degree of pain is expected that is not controlled by appropriate amounts of topical anesthetics, consumers should ask their physician for alternatives techniques for pain control.

Additional information can be found at http://www.fda.gov/medwatch/safety/2009/safety09.htm#Anesthetics

Pronunciation(LYE doe kane & TET ra kane)

U.S. Brand NamesPliaglis™; Synera™

Pharmacologic CategoryAnalgesic, Topical; Local Anesthetic

Use: Labeled IndicationsTopical anesthetic for use on normal intact skin for minor procedures (eg, I.V. cannulation or venipuncture) and superficial dermatologic procedures

Dosing: Adults

Superficial dermatological procedures (eg, dermal filler injection, facial laser ablation): Topical cream (Pliaglis™): Apply 20-30 minutes prior to procedure

Laser-assisted tattoo removal: Topical cream (Pliaglis™): Apply 60 minutes prior to procedure

Note: The amount of Pliaglis™ required is determined by the size of the treatment area. Use the ruler on the carton and in the packaging to measure out the proper amount (cm length of cream). Apply evenly and thinly (~1 mm or the thickness of a dime) over the area using a flat tool (eg, spatula, tongue depressor).

If surface area of treatment site:

10 cm^2: Apply 3 cm Pliaglis™

20 cm^2: Apply 6 cm Pliaglis™

40 cm^2: Apply 12 cm Pliaglis™

80 cm^2: Apply 24 cm Pliaglis™

100 cm^2: Apply 30 cm Pliaglis™

150 cm^2: Apply 46 cm Pliaglis™

200 cm^2: Apply 61 cm Pliaglis™

250 cm^2: Apply 76 cm Pliaglis™

300 cm^2: Apply 91 cm Pliaglis™

350 cm^2: Apply 106 cm Pliaglis™

400 cm^2: Apply 121 cm Pliaglis™

After waiting the required application time, remove the Pliaglis™ by grasping a free edge and pulling it away from the skin.

Venipuncture or intravenous cannulation: Transdermal patch: Prior to procedure, apply to intact skin for 20-30 minutes; **Note:** Adults can use another patch at a new location to facilitate venous access after a failed attempt; remove previous patch.

Superficial dermatological procedures: Transdermal patch: Prior to procedure, apply to intact skin for 30 minutes

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Venipuncture or intravenous cannulation: Children ≥3 years: Transdermal patch: Refer to adult dosing.

Superficial dermatological procedures: Children ≥3 years: Transdermal patch: Refer to adult dosing.

Dosing: Hepatic Impairment

Use caution in patients with severe hepatic dysfunction.

Administration: Topical

Cream: Pliaglis™: Apply to intact, healthy skin. Remove if irritation or burning occur. After proper application time, remove from skin and dispose of carefully. Wash hands after applying.

Transdermal patch: Synera™: Apply to intact, healthy skin. Use immediately after opening pouch. Patch begins to heat once removed from pouch. May increase skin temperature by 5°C, will not exceed 40°C. If irritation or burning occurs during application, remove patch. Wash hands after applying. Do not cut the patch or remove the top cover. Do not cover the holes on the top side of the patch. Carefully dispose of used patches as they contain large amounts of lidocaine and tetracaine. Fold adhesive together.

Storage

Pliaglis™: Store at 2°C to 8°C (36°F to 46°F). Do not freeze.

Synera™: Store at 23°C to 27°C (73°F to 81°F).

ContraindicationsHypersensitivity to lidocaine, tetracaine, amide or ester-type anesthetic agents, para-aminobenzoid acid (PABA), or any other component of the formulation
Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity/anaphylactic reactions: May occur.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- Class I antiarrhythmics: Use with caution in patients receiving class I antiarrhythmic drugs, since systemic absorption occurs and synergistic toxicity is possible.

- Methemoglobinemia: Has been reported with local anesthetics including tetracaine. Use caution in patients with lung diseases (asthma, bronchitis, emphysema, in smokers), inflamed/damaged mucosa, heart disease, children <12 months of age, concurrent use with methemoglobin-inducing medications, and hemoglobin or enzyme abnormalities (glucose-6-phosphodiesterase deficiency, hemoglobin-M disease, NADH-methemoglobin reductase deficiency, pyruvate-kinase deficiency).

- Other local anesthetics: If being used with other products containing local anesthetic, consider potential for additive effects.

Special populations:

- Acutely-ill patients: Use with caution in acutely ill patients.

- Debilitated patients: Use with caution in debilitated patients.

- Elderly: Use with caution in the elderly.

- Pediatrics: Synera™ transdermal patch: Efficacy has not been established in patients <3 years of age (safety has been documented in limited trials). Pliaglis™ topical cream: Safety and efficacy in children have not been established.

- Pseudocholinesterase deficiency: Use with caution in patients with pseudocholinesterase deficiency; greater risk of lidocaine/tetracaine toxicity.

Other warnings/precautions:

- Appropriate use: Avoid contact with eye; loss of protective reflexes may predispose to corneal irritation and/or abrasion. Application to broken or inflamed skin or mucous membranes may lead to increased systemic absorption. Not for use at home.

- MRI: Synera™: Remove patch prior to MRI.

- Multiple patch application: Synera™: Although the incidence of systemic adverse reactions is very low, caution should be exercised when applying simultaneous or sequential application of multiple patches to adults; this practice is not recommended with children.

Geriatric ConsiderationsThe manufacturer reports that in clinical studies there were no significant differences in safety between geriatric adjustments and younger subjects.

Pregnancy Risk FactorB

Pregnancy ConsiderationsSee individual agents.

LactationEnters breast milk (lidocaine in small amounts)/compatible

Adverse Reactions

>10%: Dermatologic: Erythema (47% to 71%), skin discoloration (<4% to 16%), edema (12% to 14%), blanching (12%)

1% to 10%: Dermatologic: Application site reactions (contact dermatitis, rash)

<1%: Acne, allergic reaction, anaphylactoid reaction, angioedema, blister, bronchospasm, bruising, confusion, dehydration, diaphoresis, dizziness, fever, headache, hyperventilation, hypotension, infection, nausea, nervousness, pain, pallor, paresthesia, petechiae, pharyngitis, pruritus, somnolence, stupor, syncope, urticaria, vesiculobullous rash, vomiting

Metabolism/Transport EffectsLidocaine: **Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP1A2 (strong), 2D6 (strong), 3A4 (moderate)

Drug InteractionsThere are no known significant interactions.

Monitoring Parameters

Effectiveness of anesthesia

Nursing: Physical Assessment/MonitoringAssess for history of allergies. Explain change in sensation patient will experience. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Patient EducationSynera™: The patch is used short-term for the purpose of local anesthetic prior to a procedure such as venipuncture. Wash hands after handling the patch. Avoid contact to eye, mucous membranes, or on broken or inflamed skin. Dispose of patch carefully. Used patches will still have residual medication which could harm a small child or animal if chewed or ingested. Remove from body prior to magnetic resonance imaging.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical:

Pliaglis™: Lidocaine 7% and tetracaine 7% (30 g)

Transdermal system:

Synera™: Lidocaine 70 mg and tetracaine 70 mg (10s) [contains heating component; each patch is ~50 cm^2]

Generic AvailableNo

Mechanism of Action Local anesthetic action occurs by stabilization of neuronal membranes and inhibiting the sodium ion fluxes required for the initiation and conduction of impulses.

Synera™: A heating mechanism within the patch enhances drug delivery.

Pharmacodynamics/KineticsAlso see individual agents.

Duration: Cream: ~11 hours

Absorption: Related to duration of application and area where applied.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsTetracaine and Lidocaine

International Brand NamesRapydan (SE)

Lidocaine Transoral

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(LYE doe kane trans OR al)
U.S. Brand NamesDentiPatch®
Pharmacologic CategoryLocal Anesthetic, Transoral
Use: Labeled IndicationsLocal anesthesia of the oral mucosa prior to oral injections and soft-tissue dental procedures
Use: Dental

Local anesthesia of the oral mucosa prior to oral injections and soft-tissue dental procedures

Dosing: AdultsLocal anesthesia of the oral mucosa (prior to oral injections): Topical: One patch on selected area of oral mucosa
Dosing: ElderlyRefer to adult dosing.
Dietary ConsiderationsOral patch with lidocaine 46.1 mg/2 cm^2 contains phenylalanine 0.62 mg.
ContraindicationsHypersensitivity to lidocaine or any of component of the formulation
Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Adverse ReactionsNo data reported
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Patch, oral: 46.1 mg/2 cm^2 (50s, 100s) [contains phenylalanine 0.62 mg/patch; spearmint flavor]

Generic AvailableNo
Mechanism of ActionBlocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction
Pharmacodynamics/Kinetics

Onset of action: 2 minutes

Duration: Anesthesia: 40 minutes after 15-minute wear period

Dental Health Professional ConsiderationsPeak plasma levels were 10% of those seen following local infiltration anesthesia with 1.8 mL lidocaine and 1:100,000 epinephrine.

The manufacturer claims DentiPatch® is safe, with “negligible systemic absorption” of lidocaine. The agent is “clinically proven to prevent injection pain from 25-gauge needles that are inserted to the level of the bone.” Data from controlled studies (235 patients) have shown no serious adverse effects with the application of lidocaine patch to the oral mucosa for 15 minutes.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Topical Anesthetic Use for Cosmetic or Medical Procedures: Public Health Advisory - January 2009

The Food and Drug Administration (FDA) is issuing a Public Health Advisory to remind consumers, caregivers, and healthcare professionals of potential life-threatening side effects associated with the use of topical anesthetics available as prescription and over-the-counter (OTC) products for a variety of uses, including numbing skin prior to cosmetic or medical procedures (topical lidocaine has been recently evaluated to relieve mammography discomfort). Topical application can result in high systemic levels and lead to toxic effects (eg, irregular heart beats, seizures, coma, respiratory depression, death). At risk are consumers, particularly without the supervision of trained professionals, who apply large amounts of anesthetics (or cover large areas of the skin), leave these products on for long periods of time, or use materials, wraps, or dressings to cover the skin after anesthetic application. The FDA is working with healthcare professional organizations and other media to spread the message about the potential hazards and safe use of topical anesthetics. The FDA is recommending that if topical anesthetics are needed prior to procedures, consumers ask their healthcare provider for instructions on safe use of these products, use only FDA-approved products, and use products with the lowest amount of anesthetic while applying the least amount possible to relieve pain. If a high degree of pain is expected that is not controlled by appropriate amounts of topical anesthetics, consumers should ask their physician for alternatives techniques for pain control.

Additional information can be found at http://www.fda.gov/medwatch/safety/2009/safety09.htm#Anesthetics

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (epidural administration; I.V. formulation) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

International issues:

Lidpen® may be confused with Linoten® which is a brand name for pamidronate in Spain

Pronunciation(LYE doe kane)

U.S. Brand NamesAkten™; Anestacon®; Anestafoam™ [OTC]; Band-Aid® Hurt-Free™ Antiseptic Wash [OTC]; Burn Jel® [OTC]; Burn-O-Jel [OTC]; Burnamycin [OTC]; L-M-X™ 4 [OTC]; L-M-X™ 5 [OTC]; LidaMantle®; Lidoderm®; LTA® 360; Premjact® [OTC]; Solarcaine® Aloe Extra Burn Relief [OTC]; Topicaine® [OTC]; Unburn®; Xylocaine®; Xylocaine® MPF; Xylocaine® Viscous; Zilactin-L® [OTC]; Zingo™

Canadian Brand NamesBetacaine®; Lidodan™; Lidoderm®; Xylocaine®; Xylocard®; Zilactin®

Pharmacologic CategoryAnalgesic, Topical; Antiarrhythmic Agent, Class Ib; Local Anesthetic; Local Anesthetic, Ophthalmic

Use: Labeled IndicationsLocal anesthetic and acute treatment of ventricular arrhythmias (such as from myocardial infarction or cardiac manipulation)

Intradermal: To provide local anesthesia prior to venipuncture or peripheral I.V. cannulation

Ophthalmic: To provide local anesthesia to ocular surface during ophthalmologic procedures

Rectal: Temporary relief of pain and itching due to anorectal disorders

Topical: Local anesthetic for use in laser, cosmetic, and outpatient surgeries; minor burns, cuts, and abrasions of the skin

Lidoderm® Patch: Relief of allodynia (painful hypersensitivity) and chronic pain in postherpetic neuralgia

Use: Unlabeled/InvestigationalACLS guidelines (not considered drug of choice): Stable monomorphic VT (preserved ventricular function), polymorphic VT (preserved ventricular function), drug-induced monomorphic VT

Use: DentalAmide-type injectable local anesthetic and topical local anesthetic; Patch: Production of mild topical anesthesia of accessible mucous membranes of the mouth prior to superficial dental procedures

Dosing: Adults

Antiarrhythmic:

I.V.: 1-1.5 mg/kg bolus over 2-3 minutes; may repeat doses of 0.5-0.75 mg/kg in 5-10 minutes up to a total of 3 mg/kg; continuous infusion: 1-4 mg/minute

Ventricular fibrillation or pulseless ventricular tachycardia (after defibrillation, CPR, and vasopressor administration): I.V.: Initial: 1-1.5 mg/kg. Refractory ventricular tachycardia or ventricular fibrillation, a repeat 0.5-0.75 mg/kg bolus may be given every 5-10 minutes after initial dose for a maximum of 3 doses. Total dose should not exceed 3 mg/kg. Follow with continuous infusion (1-4 mg/minute) after return of perfusion. Reappearance of arrhythmia during constant infusion: 0.5 mg/kg bolus and reassessment of infusion.

E.T. (loading dose only): 2-2.5 times the I.V. dose

Note: Decrease dose in patients with CHF, shock, or hepatic disease.

Anesthesia, local injectable: Varies with procedure, degree of anesthesia needed, vascularity of tissue, duration of anesthesia required, and physical condition of patient; maximum: 4.5 mg/kg/dose; do not repeat within 2 hours.

Anesthesia, ocular: Apply 2 drops to ocular surface in area where procedure will occur; may reapply to maintain effect

Anesthetic, topical:

Cream:

LidaMantle®: Skin irritation: Apply to affected area 2-3 times/day as needed

L-M-X™ 4: Apply $^{1}/_{4}$ inch thick layer to intact skin. Leave on until adequate anesthetic effect is obtained. Remove cream and cleanse area before beginning procedure.

L-M-X™ 5: Relief of anorectal pain and itching: Rectal: Apply topically to clean, dry area **or** using applicator, insert rectally, up to 6 times/day

Gel, ointment, solution: Apply to affected area ≤3 times/day as needed (maximum dose: 4.5 mg/kg, not to exceed 300 mg)

Jelly: Maximum dose: 30 mL (600 mg) in any 12-hour period:

Anesthesia of male urethra: 5-30 mL (100-600 mg)

Anesthesia of female urethra: 3-5 mL (60-100 mg)

Lubrication of endotracheal tube: Apply a moderate amount to external surface only

Liquid: Cold sores and fever blisters: Apply to affected area every 6 hours as needed

Patch: Postherpetic neuralgia: Apply patch to most painful area. Up to 3 patches may be applied in a single application. Patch may remain in place for up to 12 hours in any 24-hour period.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Antiarrhythmic:

I.V., I.O.: **Note:** For use in pulseless VT or VF, give after defibrillation, CPR, and epinephrine:

Loading dose: 1 mg/kg (maximum 100 mg); follow with continuous infusion; may administer second bolus of 0.5-1 mg/kg if delay between bolus and start of infusion is >15 minutes

Continuous infusion: 20-50 mcg/kg/minute. Use 20 mcg/kg/minute in patients with shock, hepatic disease, cardiac arrest, mild CHF; moderate-to-severe CHF may require $^{1}/_{2}$ loading dose and lower infusion rates to avoid toxicity.

E.T.: 2-3 mg/kg; flush with 5 mL of NS and follow with 5 assisted manual ventilations

Anesthetic, ocular: Refer to adult dosing

Anesthetic, topical:

Cream:

LidaMantle®: Skin irritation: Refer to adult dosing.

L-M-X™ 4: Children ≥2 years: Refer to adult dosing.

L-M-X™ 5: Relief of anorectal pain and itching: Rectal: Children ≥12 years: Refer to adult dosing.

Jelly: Children ≥10 years: Dose varies with age and weight (maximum dose: 4.5 mg/kg)

Liquid: Cold sores and fever blisters: Children ≥5 years: Refer to adult dosing.

Injectable local anesthetic: Refer to adult dosing.

Anesthesia, intradermal: Children 3-18 years: Zingo™: 0.5 mg to site of venipuncture or peripheral I.V. cannulation, 1-3 minutes prior to procedure. Procedure should be started within 10 minutes of application.

Dosing: Renal ImpairmentNot dialyzable (0% to 5%) by hemo- or peritoneal dialysis; supplemental dose is not necessary.

Dosing: Hepatic ImpairmentReduce dose in acute hepatitis and decompensated cirrhosis by 50%.

Calculations

- Lidocaine

Administration: I.V.Use microdrip (60 drops/mL) or infusion pump to administer an accurate dose.

Infusion rates: 2 g/250 mL D_5W (infusion pump should be used):

1 mg/minute: 7.5 mL/hour

2 mg/minute: 15 mL/hour

3 mg/minute: 22.5 mL/hour

4 mg/minute: 30 mL/hour

Buffered lidocaine for injectable local anesthetic: Add 2 mL of sodium bicarbonate 8.4% to 18 mL of lidocaine 1%

Administration: I.V. DetailLocal thrombophlebitis may occur in patients receiving prolonged I.V. infusions.

pH: 5-7 (injection); 3.5-6.0 (premixed infusion solution in D_5W)

Administration: Topical

Gel (Topicaine®): Avoid mucous membranes; remove prior to laser treatment.

Transdermal: Apply to painful area of skin immediately after removal from protective envelope. May be cut to appropriate size. After removal from skin, fold used transdermal systems so the adhesive side sticks to itself. Remove immediately if burning sensation occurs. Wash hands after application.

Intradermal (Zingo™): Apply to intact skin do not use on mucous membranes. When placing intradermal injection system on skin, hold device perpendicular to skin and seal to avoid gaps between system and skin which would impair drug delivery. A "popping" sound will indicate dose has been discharged. If needed, may apply at a new location following failed attempt at venous access; do not apply multiple times at the same site.

Administration: OtherEndotracheal: Dilute in NS or distilled water. Absorption is greater with distilled water, but causes more adverse effects on PaO_2. Pass catheter beyond tip of tracheal tube, stop compressions, spray drug quickly down tube. Follow immediately with several quick insufflations and continue chest compressions.

Dietary ConsiderationsPremixed injection may contain corn-derived dextrose and its use is contraindicated in patients with allergy to corn-related products.

Storage

Injection: Stable at room temperature. Stability of parenteral admixture at room temperature (25°C) is the expiration date on premixed bag; out of overwrap stability is 30 days.

Ophthalmic: Store at 15°C to 25°C (59°F to 77°F). Protect from light. Discard after use.

ReconstitutionStandard diluent: 2 g/250 mL D_5W.

CompatibilityStable in D_5LR, $D_5{}^1/_2NS$, D_5NS, D_5W, LR, ${}^1/_4NS$, NS.

Y-site administration: Compatible: Alteplase, amiodarone, cefazolin, ciprofloxacin, cisatracurium, clarithromycin, diltiazem, dobutamine, dobutamine with dopamine, dobutamine with nitroglycerin, dobutamine with sodium nitroprusside, dopamine, dopamine with nitroglycerin, dopamine with sodium nitroprusside, enalaprilat, etomidate, famotidine, gatifloxacin, haloperidol, heparin, heparin with hydrocortisone sodium succinate, inamrinone, labetalol, levofloxacin, linezolid, meperidine, morphine, nitroglycerin, nitroglycerin with sodium nitroprusside, potassium chloride, propofol, remifentanil, sodium nitroprusside, streptokinase, theophylline, tirofiban, vitamin B complex with C, warfarin. **Incompatible:** Amphotericin B cholesteryl sulfate complex, thiopental.

Compatibility in syringe: Compatible: Clonidine with fentanyl, glycopyrrolate, heparin, hydroxyzine, ketamine with morphine, metoclopramide, milrinone, moxalactam, nalbuphine. **Incompatible:** Cefazolin. **Variable (consult detailed reference):** Ampicillin, ceftriaxone, sodium bicarbonate.

Compatibility when admixed: Compatible: Alteplase, aminophylline, amiodarone, atracurium, bretylium, bupivacaine, calcium chloride, calcium gluconate, chloramphenicol, chlorothiazide, cimetidine, clonidine, dexamethasone sodium phosphate, digoxin, diphenhydramine, dobutamine, dopamine, ephedrine, erythromycin lactobionate, fentanyl, floxacillin, flumazenil, furosemide, heparin, hydrocortisone sodium succinate, hydroxyzine, insulin (regular), ketamine, mephentermine, metaraminol, morphine, nafcillin, nitroglycerin, penicillin G potassium, pentobarbital, phenylephrine, potassium chloride, procainamide, prochlorperazine edisylate, promazine, propafenone, ranitidine, sodium bicarbonate, sodium lactate, tetracaine, theophylline, verapamil, vitamin B complex with C. **Incompatible:** Amphotericin B, dacarbazine, methohexital, phenytoin. **Variable (consult detailed reference):** Epinephrine, isoproterenol, norepinephrine.

ContraindicationsHypersensitivity to lidocaine or any component of the formulation; hypersensitivity to another local anesthetic of the amide type; Adam-Stokes syndrome; severe degrees of SA, AV, or intraventricular heart block (except in patients with a functioning artificial pacemaker); premixed injection may contain corn-derived dextrose and its use is contraindicated in patients with allergy to corn-related products

Allergy Considerations

- Local Anesthetic Hypersensitivity/Allergy

Warnings/Precautions

Disease-related concerns:

- Hepatic dysfunction: Use extreme caution in patients with severe hepatic dysfunction; may have increased risk of lidocaine toxicity.

- Pseudocholinesterase deficiency: Use caution in patients with pseudocholinesterase deficiency; may have increased risk of lidocaine toxicity

Dosage form specific issues:

- Injectable anesthetic: Follow appropriate administration techniques so as not to administer any intravascularly. Solutions containing antimicrobial preservatives should not be used for epidural or spinal anesthesia. Some solutions contain a bisulfite; avoid in patients who are allergic to bisulfite. Resuscitative equipment, medicine and oxygen should be available in case of emergency. Use products containing epinephrine cautiously in patients with significant vascular disease, compromised blood flow, or during or following general anesthesia (increased risk of arrhythmias). Adjust the dose for the elderly, pediatric, acutely ill, and debilitated patients.

- Intradermal: For use on intact skin where adequate seal can be maintained. Do not apply to body orifices or mucous membranes. Use caution in patients with bleeding tendencies or platelet disorders; may have increased risk of superficial dermal bleeding. Safety and efficacy have not been established in children <3 years of age or adults.

- Intravenous: Constant ECG monitoring is necessary during I.V. administration. Use cautiously in hepatic impairment, any degree of heart block, Wolff-Parkinson-White syndrome, HF, marked hypoxia, severe respiratory depression, hypovolemia, history of malignant hyperthermia, or shock. Increased ventricular rate may be seen when administered to a patient with atrial fibrillation. Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy. Correct any underlying causes of ventricular arrhythmias. Monitor closely for signs and symptoms of CNS toxicity. The elderly may be prone to increased CNS and cardiovascular side effects. Reduce dose in hepatic dysfunction and CHF.

- Ophthalmic: For ophthalmic use only; not for injection. Prolonged use may cause permanent corneal ulceration and/or opacification with loss of vision.

- Topical: Do not leave on large body areas for >2 hours. Potentially life threatening side effects (eg, irregular heart beat, seizures, coma, respiratory depression, death) have occurred when used prior to cosmetic procedures. Observe young children closely to prevent accidental ingestion. Not for ophthalmic use. Some products are not recommended for use on mucous membranes; consult specific product labeling.

- Transdermal patch: Safety and efficacy have not been established in children.

Other warnings/precautions:

- CAST trial: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide. An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

Geriatric ConsiderationsDue to decreases in Phase I metabolism and possibly decrease in splanchnic perfusion with age, there may be a decreased clearance or increased half-life in the elderly and increased risk for CNS side effects and cardiac effects.
Pregnancy Risk FactorB
Pregnancy ConsiderationsAnimal studies with lidocaine have not shown teratogenic effects. Use is not contraindicated during labor and delivery. Systemic exposure following use of the intradermal system is below the limit of detection.
LactationEnters breast milk (small amounts)/use caution (AAP rates “compatible”)
Adverse ReactionsEffects vary with route of administration. Many effects are dose related.

Frequency not defined.

Cardiovascular: Arrhythmia, bradycardia, arterial spasms, cardiovascular collapse, defibrillator threshold increased, edema, flushing, heart block, hypotension, sinus node supression, vascular insufficiency (periarticular injections)

Central nervous system: Agitation, anxiety, apprehension, coma, confusion, disorientation, dizziness, drowsiness, euphoria, hallucinations, headache, hyperesthesia, hypoesthesia, lethargy, lightheadedness, nervousness, psychosis, seizure, slurred speech, somnolence, unconsciousness

Dermatologic: Angioedema, bruising (transdermal system), contact dermatitis, depigmentation (transdermal system), edema of the skin, itching, petechia (transdermal system), pruritus, rash, urticaria

Gastrointestinal: Metallic taste, nausea, vomiting

Local: Burning (ophthalmic), irritation (transdermal system), thrombophlebitis

Neuromuscular & skeletal: Pain exacerbation (transdermal system), paresthesia, transient radicular pain (subarachnoid administration; up to 1.9%), tremor, twitching, weakness

Ocular: Conjunctival hyperemia (ophthalmic), corneal epithelial changes (ophthalmic), diplopia, visual changes

Otic: Tinnitus

Respiratory: Bronchospasm, dyspnea, respiratory depression or arrest

Miscellaneous: Allergic reactions, anaphylactoid reaction, sensitivity to temperature extremes

Intradermal system: Application site reactions: Erythema (53%), petechiae (44%), edema (8%), bruising/burning/contusion/hemorrhage/pain (4%), pruritus (1%; equal to placebo)

Following spinal anesthesia: Positional headache (3%), shivering (2%) nausea, peripheral nerve symptoms, respiratory inadequacy and double vision (<1%), hypotension, cauda equina syndrome

Postmarketing and/or case reports: ARDS (inhalation), asystole, disorientation, methemoglobinemia, skin reaction

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2A6 (minor), 2B6 (minor), 2C9 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP1A2 (strong), 2D6 (moderate), 3A4 (moderate)

Drug Interactions

Amiodarone: May decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Beta-Blockers: May decrease the metabolism of Lidocaine. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of Lidocaine. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: May enhance the arrhythmogenic effect of Lidocaine. Disopyramide may increase the serum concentration of Lidocaine. Specifically, the unbound/free fraction of lidocaine. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Herb/Nutraceutical: St John's wort may decrease lidocaine levels; avoid concurrent use.

Reference Range

Therapeutic: 1.5-5.0 mcg/mL (SI: 6-21 µmol/L)

Potentially toxic: >6 mcg/mL (SI: >26 µmol/L)

Toxic: >9 mcg/mL (SI: >38 µmol/L)

Nursing: Physical Assessment/Monitoring Assess other medications patient may be taking for adverse interactions. **Local anesthetic:** Monitor for effectiveness of anesthesia and adverse reactions. **Dental/local anesthetic:** Use caution to prevent gagging or choking. Avoid food or drink for 1 hour. Teach patient adverse reactions to report; use and teach appropriate interventions to promote safety. **Antiarrhythmic: I.V.:** ECG and vital signs must be closely and continually monitored. Keep patient supine to reduce hypotensive effects. Assess frequently for adverse reactions or signs of CNS toxicity. Teach patient adverse reactions to report and appropriate interventions to promote safety.

Monitoring: Lab TestsI.V.: Serum lidocaine levels. Therapeutic levels range from 1.5-5 mcg/mL; >6 mcg/mL is associated with toxicity.

Patient EducationI.V.: You will be monitored during infusion. Do not get up without assistance. Report dizziness, numbness, double vision, nausea, pain or burning at infusion site, nightmares, hearing strange noises, seeing unusual visions, or respiratory difficulty.

Dermatologic: You will experience decreased sensation to pain, heat, or cold in the area and/or decreased muscle strength (depending on area of application) until effects wear off; use necessary caution to reduce incidence of possible injury until full sensation returns. Report irritation, pain, persistent numbness, tingling, swelling; restlessness, dizziness, acute weakness; blurred vision; ringing in ears; or respiratory difficulty.

Dental/local anesthetic: Lidocaine can cause numbness of tongue, cheeks, and throat. Do not eat or drink for 1 hour after use. Take small sips of water at first to ensure that you can swallow without difficulty. Your tongue and mouth may be numb; use caution avoid biting yourself. Immediately report swelling of face, lips, or tongue

Transdermal patch: Patch may be cut to appropriate size. Apply patch to most painful area. Up to 3 patches may be applied in a single application. Patch may remain in place for up to 12 hours in any 24-hour period. Remove immediately if burning sensation occurs. Wash hands after application.

Ophthalmic: May cause burning when applied.

Pregnancy precaution: Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, topical [foam]:

Anestafoam™: 4% (30 g) [contains benzalkonium chloride and benzyl alcohol]

Cream, rectal (L-M-X™ 5): 5% (15 g) [contains benzyl alcohol; packaged with applicator]; (30 g) [contains benzyl alcohol]

Cream, topical (L-M-X™ 4): 4% (5 g) [contains benzyl alcohol; packaged with Tegaderm™ dressing]; (15 g, 30 g) [contains benzyl alcohol]

Cream, topical, as hydrochloride: 3% (30 g)

LidaMantle®: 3% (30 g, 85 g)

Gel, ophthalmic:

Akten™: 3.5% (5 mL) [preservative free]

Gel, topical:

Burn-O-Jel: 0.5% (90 g)

Topicaine®: 4% (10 g, 30 g, 113 g) [contains alcohol 35%, benzyl alcohol, aloe vera, and jojoba]

Gel, topical, as hydrochloride:

Burn Jel®: 2% (3.5 g, 120 g)

Solarcaine® Aloe Extra Burn Relief: 0.5% (113 g, 226 g) [contains aloe vera gel and tartrazine]

Unburn®: 2.5% (3.5 g, 59 mL, 118 mL) [contains vitamin E]

Infusion, as hydrochloride [premixed in D_5W]: 0.4% [4 mg/mL] (250 mL, 500 mL); 0.8% [8 mg/mL] (250 mL, 500 mL)

Injection, solution, as hydrochloride: 0.5% [5 mg/mL] (50 mL); 1% [10 mg/mL] (2 mL, 10 mL, 20 mL, 30 mL, 50 mL); 2% [20 mg/mL] (2 mL, 5 mL, 20 mL, 50 mL)

Xylocaine®: 0.5% [5 mg/mL] (50 mL); 1% [10 mg/mL] (10 mL, 20 mL, 50 mL); 2% [20 mg/mL] (1.8 mL, 10 mL, 20 mL, 50 mL)

Injection, solution, as hydrochloride [preservative free]: 0.5% [5 mg/mL] (50 mL); 1% [10 mg/mL] (2 mL, 5 mL, 30 mL); 1.5% [15 mg/mL] (20 mL); 2% [20 mg/mL] (2 mL, 5 mL, 10 mL); 4% [40 mg/mL] (5 mL)

Xylocaine®: 10% [100 mg/mL] (5 mL) [for ventricular arrhythmias]

Xylocaine® MPF: 0.5% [5 mg/mL] (50 mL); 1% [10 mg/mL] (2 mL, 5 mL, 10 mL, 30 mL); 1.5% [15 mg/mL] (10 mL, 20 mL); 2% [20 mg/mL] (2 mL, 5 mL, 10 mL); 4% [40 mg/mL] (5 mL)

Injection, solution, as hydrochloride [premixed in $D_{7.5}W$, preservative free]: 5% (2 mL)

Xylocaine® MPF: 1.5% (2 mL) [DSC]

Jelly, topical, as hydrochloride: 2% (5 mL, 30 mL)

Anestacon®: 2% (15 mL) [contains benzalkonium chloride]

Xylocaine®: 2% (5 mL, 30 mL)

Liquid, topical (Zilactin®-L): 2.5% (7.5 mL)

Lotion, topical, as hydrochloride (LidaMantle®): 3% (177 mL)

Ointment, topical: 5% (37 g, 50 g)

Powder, intradermal, as hydrochloride:

Zingo™: 0.5 mg

Solution, topical, as hydrochloride: 4% [40 mg/mL] (50 mL)

Band-Aid® Hurt-Free™ Antiseptic Wash: 2% (180 mL)

LTA® 360: 4% [40 mg/mL] (4 mL) [packaged with cannula for laryngotracheal administration]

Xylocaine®: 4% [40 mg/mL] (50 mL)

Solution, viscous, as hydrochloride: 2% [20 mg/mL] (20 mL, 100 mL)

Xylocaine® Viscous: 2% [20 mg/mL] (100 mL, 450 mL)

Spray, topical:

Burnamycin: 0.5% (60 mL) [contains aloe vera gel and menthol]

Premjact®: 9.6% (13 mL)

Solarcaine® Aloe Extra Burn Relief: 0.5% (127 g) [contains aloe vera]

Transdermal system, topical (Lidoderm®): 5% (30s)

Mechanism of ActionClass Ib antiarrhythmic; suppresses automaticity of conduction tissue, by increasing electrical stimulation threshold of ventricle, His-Purkinje system, and spontaneous depolarization of the ventricles during diastole by a direct action on the tissues; blocks both the initiation and conduction of nerve impulses by decreasing the neuronal membrane's permeability to sodium ions, which results in inhibition of depolarization with resultant blockade of conduction

Pharmacodynamics/Kinetics

Onset of action: Single bolus dose: 45-90 seconds; Intradermal: 1-3 minutes; Ophthalmic: 20 seconds to 5 minutes (median: 40 seconds)

Duration: 10-20 minutes; Intradermal: Decreases after 10 minutes; Ophthalmic: 5-30 minutes (median: 15 minutes)

Absorption: Intradermal: Below limit of detection (<5 ng/mL)

Distribution: V_d: 1.1-2.1 L/kg; alterable by many patient factors; decreased in CHF and liver disease; crosses blood-brain barrier

Protein binding: 60% to 80% to alpha_1 acid glycoprotein

Metabolism: 90% hepatic; active metabolites monoethylglycinexylidide (MEGX) and glycinexylidide (GX) can accumulate and may cause CNS toxicity

Half-life elimination: Biphasic: Prolonged with congestive heart failure, liver disease, shock, severe renal disease; Initial: 7-30 minutes; Terminal: Infants, premature: 3.2 hours, Adults: 1.5-2 hours

Excretion: Urine (<10% as unchanged drug, ~90% as metabolites)

Related Information

- Antiarrhythmic Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause agitation, anxiety, euphoria, or hallucinations

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsThe prophylactic use of lidocaine in patients after myocardial infarction confers no benefit and in fact may be harmful. Great care is needed in administration of lidocaine in the elderly and in patients with heart failure, shock, or hepatic disease, as toxic effects of lidocaine may become evident earlier in these patients. This is especially problematic since lidocaine-induced seizures may induce extension of underlying myocardial infarction. It is important to recognize that lidocaine has a narrow therapeutic index. Severe toxicity may occur at levels slightly above the therapeutic range, particularly when lidocaine is administered together with other antiarrhythmic drugs. While lidocaine toxicity may elicit seizures, lidocaine may also cause respiratory arrest and cardiac toxicity (AV block, asystole, and hypotension).

Anesthesia and Critical Care Concerns/Other Considerations

Cardiac Arrest: Amiodarone was recently compared to lidocaine (ALIVE trial) in out-of-hospital cardiac arrest victims whose ventricular fibrillation was resistant to 3 defibrillation attempts in addition to epinephrine and a fourth defibrillation attempt (Dorian, 2002). Other inclusion criteria included ventricular fibrillation unrelated to trauma (or with other arrhythmias that converted to ventricular fibrillation) and recurrent ventricular fibrillation after successful initial defibrillation. This was a randomized, double-blind comparison. The primary endpoint was the number of patients who were admitted to the hospital intensive care unit alive. Three hundred and forty-seven patients were enrolled. The initial amiodarone dose was 5 mg/kg and the lidocaine dose was 1.5 mg/kg. If ventricular fibrillation persisted after another shock, then the study drug could be administered again (amiodarone 2.5 mg/kg, lidocaine 1.5 mg/kg). Significantly more amiodarone patients (~23%) were admitted to the hospital alive than lidocaine patients (12%). The majority (>90%) of patients in the ALIVE trial had ventricular fibrillation as the initial arrhythmia. The authors concluded that intravenous amiodarone is superior to lidocaine in the treatment of shock-resistant, out-of-hospital ventricular fibrillation. Lidocaine is not as effective as amiodarone for improving intermediate outcomes, but neither has improved survival until hospital discharge among patients with VF cardiac arrest.

Monitoring: Great care is needed in administration of lidocaine in the elderly and in patients with heart failure, shock, or hepatic disease, as toxic effects of lidocaine may become evident earlier in these patients. The half-life of lidocaine increases after 24-48 hours as the drug inhibits its own hepatic metabolism. The dose should be reduced after 24 hours or blood levels should be monitored. While lidocaine toxicity may elicit seizures, lidocaine may also cause respiratory arrest and cardiac toxicity (eg, sinus arrest, AV block, asystole, and hypotension).

Local anesthetic toxicity: Cardiac arrest: Lipid infusion has been used in animal studies and several human cases (Bupivacaine: Rosenblatt, 2006; Levobupivacaine: Foxall, 2007; Ropivacaine: Litz, 2006) where cardiovascular toxicity, unresponsive to conventional resuscitation, resulted. Additional information is available at http://www.lipidrescue.org. The protocol from the website is: **20% Fat Emulsion:** 1.5 mL/kg administered over 1 minute, followed immediately by an infusion of 0.25 mL/kg/minute. Continue chest compressions (lipid must circulate). Repeat bolus every 3-5 minutes up to 3 mL/kg total dose until circulation restored. Continue infusion until hemodynamic stability is restored. Increase the infusion rate to 0.5 mL/kg/minute if BP declines. A maximum total dose of 8 mL/kg is recommended.

Index TermsLidocaine Hydrochloride; Lignocaine Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lincocin® may be confused with Cleocin®, Indocin®, Minocin®

International issues:

Lincocin® may be confused with Lidosen® which is a brand name for lidocaine in Italy

Lincocin® may be confused with Limoxin® which is a brand name for amoxicillin in Mexico

Pronunciation(lin koe MYE sin)

U.S. Brand NamesLincocin®

Canadian Brand NamesLincocin®

Pharmacologic CategoryAntibiotic, Lincosamide

Use: Labeled IndicationsTreatment of serious susceptible bacterial infections, mainly those caused by streptococci, pneumococci, and staphylococci resistant to other agents

Dosing: Adults **Note:** Frequency may be increased if needed due to severity of infection

Susceptible infections:

I.M.: 600 mg every 12-24 hours

I.V.: 600 mg to 1 g every 8-12 hours; maximum dose: 8 g/day

Subconjunctival injection: 75 mg (ocular fluid levels with sufficient MICs last for at least 5 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Frequency may be increased if needed due to severity of infection

Susceptible infections in Children >1 month:

I.M.: 10 mg/kg every 12-24 hours

I.V.: 10-20 mg/kg/day in divided doses every 8-12 hours

Dosing: Renal ImpairmentSevere impairment: Decrease dose by 70% to 75%; not removed by peritoneal or hemodialysis.

Dosing: Hepatic ImpairmentUse caution in hepatic impairment. No specific guidelines available; consider dosage adjustment and/or monitor levels closely.

Administration: I.V.Administer over at least 1 hour per 100 mL; cardiopulmonary arrest and hypotension have been reported following too rapid I.V. infusion.

StoragePrior to dilution, store vials at controlled room temperature of 20°C to 25°C (68°F to 77°F). Once diluted, may store for 24 hours at room temperature.

ReconstitutionEach gram of lincomycin for I.V. administration should be diluted with at least 100 mL of solution. Dilute 600 mg in 100 mL of solution.

CompatibilityStable in dextran 6% in NS, D_5NS, $D_{10}NS$, D_5W, $D_{10}W$, NS.

Compatibility in syringe: Compatible: Cloxacillin, doxapram, heparin, penicillin G sodium. **Incompatible:** Ampicillin.

Compatibility when admixed: Compatible: Amikacin, ampicillin, chloramphenicol, cimetidine, cytarabine, heparin, polymyxin B sulfate, ranitidine, vitamin B complex, vitamin B complex with C. **Incompatible:** Kanamycin, phenytoin. **Variable (consult detailed reference):** Colistimethate, penicillin G potassium, penicillin G sodium.

ContraindicationsHypersensitivity to lincomycin, clindamycin, or any component of the formulation

Allergy Considerations

- Lincosamide Allergy

Warnings/Precautions

Boxed warnings:

• Colitis: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Colitis: **[U.S. Boxed Warning]: Can cause mild-to-severe (and possibly fatal) colitis.** Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment. Discontinue drug if significant diarrhea, abdominal cramps, or passage of blood and mucus occurs.

- Hypersensitivity reactions: Hypersensitivity reactions including anaphylaxis and rarely, erythema multiforme (resembling Stevens-Johnson syndrome) have been reported.

Disease-related concerns:

- Allergies: Use with caution in patients with significant allergies.

- Asthma: Use with caution in patients with asthma.

- Gastrointestinal disease: Use with caution in patients with a history of gastrointestinal disease (particularly colitis); discontinue if significant diarrhea occurs.

- Hepatic impairment: Use with caution in patients with hepatic impairment; half-life may be prolonged twofold.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment may be necessary with severe impairment.

Special populations:

- Elderly: Use with caution in the elderly; monitor closely for bowel changes.

Dosage form specific issues:

- Benzyl alcohol: Solution for injection contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Appropriate use: Generally reserved for use when treatment with other antibiotics is inappropriate. Not appropriate for use in the treatment of meningitis due to inadequate penetration into the CSF.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationEnters breast milk/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiopulmonary arrest and hypotension (related to rapid I.V. infusion; rare)

Central nervous system: Vertigo

Dermatologic: Dermatitis (includes exfoliative and vesiculobullous; rare), erythema multiforme (rare; some resembling SJS), rash, urticaria

Gastrointestinal: Colitis, diarrhea, glossitis, nausea, pruritus ani, stomatitis, vomiting

Genitourinary: Vaginitis

Hematologic: Agranulocytosis, aplastic anemia (rare), leukopenia, neutropenia, pancytopenia (rare), thrombocytopenic purpura

Hepatic: Jaundice, liver function test abnormal

Otic: Tinnitus

Renal: Azotemia (rare), proteinuria (rare), oliguria (rare)

Miscellaneous: Hypersensitivity reactions (anaphylaxis, angioneurotic edema, serum sickness)

Drug Interactions

Erythromycin: Lincosamide Antibiotics may diminish the therapeutic effect of Erythromycin. *Risk X: Avoid combination*

Kaolin: May decrease the absorption of Lincosamide Antibiotics. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Lincosamide Antibiotics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Monitoring ParametersChange in bowel frequency; periodic liver and kidney function tests and complete blood counts during prolonged therapy
Monitoring: Lab TestsPeriodic liver and kidney function tests and complete blood counts during prolonged therapy
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 300 mg/mL (2 mL, 10 mL) [contains benzyl alcohol]

Generic AvailableNo
Mechanism of ActionLincosamide antibiotic which was isolated from a strain of *Streptomyces lincolnensis*; lincomycin, like clindamycin, inhibits bacterial protein synthesis by specifically binding on the 50S subunit and affecting the process of peptide chain initiation. Other

macrolide antibiotics (erythromycin) also bind to the 50S subunit. Since only one molecule of antibiotic can bind to a single ribosome, the concomitant use of erythromycin and lincomycin is not recommended.

Pharmacodynamics/Kinetics

Metabolism: Hepatic

Half-life elimination, serum: ~5 hours; prolonged with renal or hepatic impairment

Time to peak, serum: I.M.: 1 hour

Excretion: Urine (2% to 30%); bile

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Glossitis and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause granulocytopenia; use caution with clozapine and carbamazepine

Index TermsLincomycin Hydrochloride

International Brand NamesAlbiotic (DE); Biolincom (ID); Cillimicina (IT); Cillimycin (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, PL, QA, SA, SY, YE); Clordelin (EC); Frademicina (AR, BR); Libiocid (MX); Licoxin (TW); Linco ANB (TH); Lincocin (AE, AU, BE, BF, BG, BH, BJ, CH, CI, CN, CO, CR, CY, CZ, EC, EG, ES, ET, GH, GM, GN, GT, HK, HN, HR, ID, IL, IQ, IR, IT, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, MX, NE, NG, NI, NL, OM, PA, PE, PH, PK, PL, QA, SA, SC, SD, SL, SN, SV, SY, TH, TN, TW, TZ, UG, VE, YE, ZA, ZM, ZW); Lincocina (PT); Lincocine (FR); Lincomed (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Lincomycin (PL); Lincono (TH); Lincophar (ID); Lincoplus (PE); Lincosa (MY); Lincosan (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Linkam (IN); Linmycin (TH); Lintropsin (ID); Medoglycin (HK); Neloren (HR, PL); Nichomycin (ID); Nolipo (ID); Princol (MX); Pritaline (ID); Tamcocin (ID); Zumalin (ID)

Lindane

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(LIN dane)

Canadian Brand NamesHexit™; PMS-Lindane

Pharmacologic CategoryAntiparasitic Agent, Topical; Pediculocide; Scabicidal Agent

Use: Labeled IndicationsTreatment of *Sarcoptes scabiei* (scabies), *Pediculus capitis* (head lice), and *Phthirus pubis* (crab lice); FDA recommends reserving lindane as a second-line agent or with inadequate response to other therapies

Dosing: Adults

Scabies: Topical: Apply a thin layer of lotion and massage it on skin from the neck to the toes; after 8-12 hours, bathe and remove the drug

Head lice, crab lice: Topical: Apply shampoo to dry hair and massage into hair for 4 minutes; add small quantities of water to hair until lather forms, then rinse hair thoroughly and comb with a fine tooth comb to remove nits. Amount of shampoo needed is based on length and density of hair; most patients will require 30 mL (maximum: 60 mL).

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: OralNever administer orally.

Administration: TopicalFor topical use only. Caregivers should apply with gloves (avoid natural latex, may be permeable to lindane). Rinse off with warm (not hot) water.

Lotion: Apply to dry, cool skin; do not apply to face or eyes. Wait at least 1 hour after bathing or showering (wet or warm skin increases absorption). Skin should be clean and free of any other lotions, creams, or oil prior to lindane application.

Shampoo: Apply to clean, dry hair. Wait at least 1 hour after washing hair before applying lindane shampoo. Hair should be washed with a shampoo not containing a conditioner; hair and skin of head and neck should be free of any lotions, oils, or creams prior to lindane application.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to lindane or any component of the formulation; uncontrolled seizure disorders; crusted (Norwegian) scabies, acutely-inflamed skin or raw, weeping surfaces or other skin conditions which may increase systemic absorption

Allergy Considerations

- Lindane Allergy

Warnings/Precautions

Boxed warnings:

- Appropriate use: See “Other warnings/precautions” below.
- Medication guide: See “Other warnings/precautions” below.
- Neurologic toxicities: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Neurologic toxicities: **[U.S. Boxed Warning]: May be associated with severe neurologic toxicities (contraindicated in premature infants and uncontrolled seizure disorders).** Seizures and death have been reported with use; use with caution in infants, small children, patients <50 kg, or patients with a history of seizures; use caution with conditions which may increase risk of seizures or medications which decrease seizure threshold.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: Not considered a drug of first choice; use only in patients who have failed first-line treatments, or in patients who cannot tolerate these agents.** Because of the potential for systemic absorption and CNS side effects, lindane should be used with caution; consider permethrin or crotamiton agent first. Oil-based hair dressing may increase toxic potential. For external use only; avoid contact with face, eyes, mucous membranes, and urethral meatus.
- Medication guide: **[U.S. Boxed Warning]: A lindane medication use guide must be given to all patients along with instructions for proper use.** Patients should be informed that itching may occur following successful killing of lice and re-treatment may not be indicated. Should

be used as a part of an overall lice management program.

Geriatric ConsiderationsBecause of the potential for systemic absorption and CNS side effects, lindane should be used with caution. Not considered a drug of first choice; consider permethrin or crotamiton agent first.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no well-controlled studies in pregnant women.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsNursing mothers should interrupt breast-feeding, express and discard milk for at least 24 hours following use.

Adverse ReactionsFrequency not defined (includes postmarketing and/or case reports).

Cardiovascular: Cardiac arrhythmia

Central nervous system: Ataxia, dizziness, headache, restlessness, seizure, pain

Dermatologic: Alopecia, contact dermatitis, skin and adipose tissue may act as repositories, eczematous eruptions, pruritus, urticaria

Gastrointestinal: Nausea, vomiting

Hematologic: Aplastic anemia

Hepatic: Hepatitis

Local: Burning and stinging

Neuromuscular & skeletal: Paresthesia

Renal: Hematuria

Respiratory: Pulmonary edema

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess head, hair, and skin surfaces for presence of lice and nits. Assess knowledge/teach patient appropriate application, use, and adverse symptoms to report.

Patient EducationFor external use only. Do not apply to face and avoid getting in eyes. Do not apply immediately after hot, soapy bath. For scabies, Apply from neck to toes. Bathe to remove drug after 8-12 hours. For head lice or crab lice, massage into dry hair for 4 minutes; add water to hair to form lather, then rinse thoroughly. Clothing and bedding must be washed in hot water or dry cleaned to kill nits. Wash combs and brushes with lindane shampoo and thoroughly rinse. May need to treat all members of household and all sexual contacts concurrently. Report if condition persists or infection occurs. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Lotion, topical: 1% (60 mL)

Shampoo, topical: 1% (60 mL) [contains alcohol 0.5%]

Generic AvailableYes

Mechanism of ActionDirectly absorbed by parasites and ova through the exoskeleton; stimulates the nervous system resulting in seizures and death of parasitic arthropods

Pharmacodynamics/Kinetics

Absorption: ≤13% systemically

Distribution: Stored in body fat; accumulates in brain; skin and adipose tissue may act as repositories

Metabolism: Hepatic

Half-life elimination: Children: 17-22 hours

Time to peak, serum: Children: 6 hours

Excretion: Urine and feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or restlessness

Mental Health: Effects on Psychiatric TreatmentMay cause aplastic anemia; use caution with clozapine and carbamazepine

Index TermsBenzene Hexachloride; Gamma Benzene Hexachloride; Hexachlorocyclohexane

Medication Safety Issues

Sound-alike/look-alike issues:

Zyvox® may be confused with Ziox™, Zosyn®, Zovirax®

Pronunciation(li NE zoh lid)
U.S. Brand NamesZyvox®
Canadian Brand NamesZyvoxam®
Pharmacologic CategoryAntibiotic, Oxazolidinone
Use: Labeled IndicationsTreatment of vancomycin-resistant *Enterococcus faecium* (VRE) infections, nosocomial pneumonia caused by *Staphylococcus aureus* including MRSA or *Streptococcus pneumoniae* (including multidrug-resistant strains [MDRSP]), complicated and uncomplicated skin and skin structure infections (including diabetic foot infections without concomitant osteomyelitis), and community-acquired pneumonia caused by susceptible gram-positive organisms
Dosing: Adults

VRE infections including concurrent bacteremia: Oral, I.V.: 600 mg every 12 hours for 14-28 days

MRSA: Oral, I.V: 600 mg every 12 hours

Nosocomial pneumonia, complicated skin and skin structure infections, community-acquired pneumonia including concurrent bacteremia: Oral, I.V.: 600 mg every 12 hours for 10-14 days

Uncomplicated skin and skin structure infections: Oral: 400 mg every 12 hours for 10-14 days

Note: 400 mg dose is recommended in the product labeling; however, 600 mg dose is commonly employed clinically

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

VRE infections including concurrent bacteremia: Oral, I.V.:

Preterm neonates (<34 weeks gestational age): 10 mg/kg every 12 hours; neonates with a suboptimal clinical response can be advanced to 10 mg/kg every 8 hours. By day 7 of life, all neonates should receive 10 mg/kg every 8 hours.

Infants (excluding preterm neonates <1 week) and Children ≤11 years: 10 mg/kg every 8 hours for 14-28 days

Children ≥12 years: Refer to adult dosing.

Nosocomial pneumonia, complicated skin and skin structure infections, community acquired pneumonia including concurrent bacteremia: Oral, I.V.:

Preterm neonates (<34 weeks gestational age): 10 mg/kg every 12 hours; neonates with a suboptimal clinical response can be advanced to 10 mg/kg every 8 hours. By day 7 of life, all neonates should receive 10 mg/kg every 8 hours.

Infants (excluding preterm neonates <1 week) and Children ≤11 years: 10 mg/kg every 8 hours for 10-14 days

Children ≥12 years: Refer to adult dosing.

Uncomplicated skin and skin structure infections: Oral:

Preterm neonates (<34 weeks gestational age): 10 mg/kg every 12 hours; neonates with a suboptimal clinical response can be advanced to 10 mg/kg every 8 hours. By day 7 of life, all neonates should receive 10 mg/kg every 8 hours.

Infants (excluding preterm neonates <1 week) and Children <5 years: 10 mg/kg every 8 hours for 10-14 days

Children 5-11 years: 10 mg/kg every 12 hours for 10-14 days

Children ≥12-18 years: 600 mg every 12 hours for 10-14 days

Dosing: Renal ImpairmentNo adjustment is recommended. The two primary metabolites may accumulate in patients with renal impairment but the clinical significance is unknown. Weigh the risk of accumulation of metabolites versus the benefit of therapy. Monitor for hematopoietic (eg, anemia, leukopenia, thrombocytopenia) and neuropathic (eg, peripheral neuropathy) adverse events when administering for extended periods. Both linezolid and the two metabolites are eliminated by dialysis. Linezolid should be given after hemodialysis.

Continuous renal replacement therapy (CRRT): No adjustment needed.

Dosing: Hepatic ImpairmentNo dosage adjustment required for mild to moderate hepatic insufficiency (Child-Pugh class A or B). Use in severe hepatic insufficiency has not been adequately evaluated.

Administration: I.V.Administer intravenous infusion over 30-120 minutes. Do not mix or infuse with other medications. When the same intravenous line is used for sequential infusion of other medications, flush line with D_5W, NS, or LR before and after infusing linezolid. The yellow color of the injection may intensify over time without affecting potency.

Administration: OralOral suspension: Invert gently to mix prior to administration, do not shake

Dietary ConsiderationsTake with or without food. Avoid consuming large amounts of tyramine-containing foods/beverages. Some examples include aged or matured cheese, air-dried or cured meats (including sausages and salamis), fava or broad bean pods, tap/draft beers, Marmite concentrate, sauerkraut, soy sauce and other soybean condiments.

Suspension contains 20 mg phenylalanine per teaspoonful. Sodium content: 0.1 mEq/tablet; 0.4 mEq/5 mL; 1.7 mEq/100 mL infusion; 3.3 mEq/200 mL infusion; 5 mEq/300 mL infusion

Storage

Infusion: Store at 25°C (77°F). Protect from light. Keep infusion bags in overwrap until ready for use. Protect infusion bags from freezing.

Oral suspension: Following reconstitution, store at 25°C (77°F). Use reconstituted suspension within 21 days. Protect from light.

Tablet: Store at 25°C (77°F). Protect from light; protect from moisture.

ReconstitutionOral suspension: Reconstitute with 123 mL of distilled water (in 2 portions); shake vigorously. Concentration is 100 mg/5 mL. Prior to administration mix gently by inverting bottle; do not shake.

CompatibilityStable in D_5W, LR, NS

Y-site administration: Compatible: Acyclovir, alfentanil, amikacin, aminophylline, ampicillin, ampicillin sulbactam, aztreonam, bretylium, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dexamethasone, dexmedetomidine, D51/2 NS, D5NS, digoxin, diphenhydramine, dobutamine, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, Esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, ifosfamide, imipenem, labetalol, leucovorin, levofloxacin, lidocaine, lorazepam, magnesium sulfate, mannitol, ,meperidine, meropenem, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metronidazole, midazolam, mitoxantrone, morphine, nalbuphine, naloxone, nicardipine, nitroglycerin, ofloxacin, ondansetron, paclitaxel, pentobarbital, phenobarbital, piperacillin (tazobactam), potassium chloride, prochlorperazine, promethazine, propranolol, ranitidine remifentanil, sodium bicarbonate, sufentanil, theophylline, tobramycin, vancomycin, vecuronium, verapamil, vincristine, zidovudine. **Incompatible:** Amphotericin B, chlorpromazine, diazepam, erythromycin, pentamidine, phenytoin, sulfamethoxazole/trimethoprim.

Compatibility when admixed: Compatible: Aztreonam, cefazolin, ceftazidime, ciprofloxacin, gentamicin, levofloxacin, ofloxacin, tobramycin. **Incompatible:** Ceftriaxone, erythromycin, sulfamethoxazole/trimethoprim.

ContraindicationsHypersensitivity to linezolid or any other component of the formulation; concurrent use or within 2 weeks of MAO inhibitors; patients with uncontrolled hypertension, pheochromocytoma, thyrotoxicosis, and/or taking sympathomimetics (eg, pseudoephedrine), vasopressive agents (eg, epinephrine, norepinephrine), or dopaminergic agents (eg, dopamine, dobutamine) unless closely monitored for increased blood pressure; patients with carcinoid syndrome and/or taking SSRIs, tricyclic antidepressants, serotonin 5-$HT_{1B,1D}$ receptor agonists, meperidine, or buspirone unless closely monitored for sign/symptoms of serotonin syndrome

Allergy Considerations

- Linezolid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Lactic acidosis: Has been reported with use. Patients who develop recurrent nausea and vomiting, unexplained acidosis, or low bicarbonate levels need immediate evaluation.
- Myelosuppression: Has been reported and may be dependent on duration of therapy (generally >2 weeks of treatment); use with caution in patients with pre-existing myelosuppression, in patients receiving other drugs which may cause bone marrow suppression, or in chronic infection (previous or concurrent antibiotic therapy). Weekly CBC monitoring is recommended; discontinue therapy in patients developing myelosuppression (or in whom myelosuppression worsens during treatment).
- Peripheral and optic neuropathy (with vision loss): Has been reported and may occur primarily with extended courses of therapy >28 days; any symptoms of visual change or impairment warrant immediate ophthalmic evaluation and possible discontinuation of therapy.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Carcinoid syndrome: Use with caution and closely monitor for serotonin syndrome in patients with carcinoid syndrome; linezolid has not been studied in patients with this condition. Use is contraindicated in the absence of close monitoring.
- Hypertension: Use with caution and closely monitor blood pressure in patients with uncontrolled hypertension; linezolid has not been studied in patients with this condition. Use is contraindicated in the absence of close monitoring.
- Hyperthyroidism: Use with caution and closely monitor blood pressure in patients with untreated hyperthyroidism; linezolid has not been studied in patients with this condition. Use is contraindicated in the absence of close monitoring.
- Pheochromocytoma: Use with caution and closely monitor blood pressure in patients with pheochromocytoma; linezolid has not been

studied in patients with this condition. Use is contraindicated in the absence of close monitoring.

- Seizure disorder: Seizures have been reported; use with caution in patients with a history of seizures.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (eg, SSRIs/SNRIs or triptans) or agents which reduce linezolid's metabolism; concurrent use with these medications is contraindicated unless patient is closely monitored for signs/symptoms of serotonin syndrome.

Special populations:

- Pediatrics: The manufacturer states that empiric use in pediatric patients with CNS infections is not recommended due to inconsistent concentrations in the CSF; however, there are multiple case reports describing successful treatment of documented VRE and *Staphylococcus aureus* CNS and shunt infections in the literature.

Dosage form specific issues:

- Phenylalanine: Oral suspension contains phenylalanine.

Other warnings/precautions:

- Appropriate use: Unnecessary use may lead to the development of resistance to linezolid; consider alternatives before initiating outpatient treatment.

- MAO inhibitor properties: Exhibits mild MAO inhibitor properties and has the potential to have the same interactions as other MAO inhibitors.

Geriatric ConsiderationsAccording to the manufacturer the pharmacokinetics of linezolid are not significantly altered in persons ≥65 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsBecause adverse effects were observed in some animal studies, linezolid is classified pregnancy category C. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if linezolid is excreted in human milk. Linezolid has low protein binding and is 100% bioavailable orally which may increase the exposure to a nursing infant. The manufacturer advises caution if administering linezolid to a breast-feeding woman. Linezolid is used therapeutically in infants. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Linezolid in Pregnancy & Lactation

Adverse ReactionsPercentages as reported in adults; frequency similar in pediatric patients

>10%:

Central nervous system: Headache (<1% to 11%)

Gastrointestinal: Diarrhea (3% to 11%)

1% to 10%:

Central nervous system: Insomnia (3%), dizziness (≤2%), fever (2%)

Dermatologic: Rash (2%)

Gastrointestinal: Nausea (3% to 10%), vomiting (1% to 4%), pancreatic enzymes increased (≤4%), constipation (2%), taste alteration (1% to 2%), tongue discoloration (≤1%), oral moniliasis (≤1%), pancreatitis

Genitourinary: Vaginal moniliasis (1% to 2%)

Hematologic: Hemoglobin decreased (1% to 7%), thrombocytopenia (≤3%), anemia, leukopenia, neutropenia; **Note:** Myelosuppression (including anemia, leukopenia, pancytopenia, and thrombocytopenia; may be more common in patients receiving linezolid for >2 weeks)

Hepatic: Abnormal LFTs (≤10%), bilirubin increased (≤1%)

Renal: BUN increased (≤2%)

Miscellaneous: Fungal infection (0.1% to 2%), lactate dehydrogenase increased (<1% to 2%)

<1% or frequency not defined: Blurred vision, *C. difficile*-related complications, creatinine increased, dyspepsia, hypertension, localized abdominal pain, pruritus

Postmarketing and/or case reports: Anaphylaxis, angioedema, bullous skin disorders, lactic acidosis, peripheral neuropathy, optic neuropathy, seizures, serotonin syndrome (with concurrent use of other serotonergic agents), Stevens-Johnson syndrome, vision loss

Drug Interactions

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X:*

Avoid combination

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Lithium: MAO Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (based on CNS depressant effects and potential tyramine content)

Food: Concurrent ingestion of foods rich in tyramine may cause sudden and severe high blood pressure (hypertensive crisis). Avoid tyramine-containing foods with MAO-Is. Food's freshness is also an important concern; improperly stored or spoiled food can create an environment where tyramine concentrations may increase.

Herb/Nutraceutical: Avoid supplements containing caffeine, tyrosine, tryptophan or phenylalanine. Ingestion of large quantities may increase the risk of severe side effects (eg, hypertensive reactions, serotonin syndrome).

Monitoring ParametersWeekly CBC and platelet counts, particularly in patients at increased risk of bleeding, with pre-existing myelosuppression, on concomitant medications that cause bone marrow suppression, in those who require >2 weeks of therapy, or in those with chronic infection who have received previous or concomitant antibiotic therapy; visual function with extended therapy (≥3 months) or in patients with new onset visual symptoms, regardless of therapy length

Nursing: Physical Assessment/MonitoringAssess for previous drug allergies before administering first dose. Assess other pharmacological agents patient may be taking for effectiveness and interactions (eg, serotonergic agents may increase resistance to linezolid and increase risk of serotonin syndrome, hypertension with adrenergic agents, or myelosuppression with other drugs that may cause bone marrow suppression). Assess results of laboratory tests (weekly CBC and platelet count), therapeutic effectiveness (resolution of infection), and adverse reactions (eg, myelosuppression [anemia, leukopenia, pancytopenia, and thrombocytopenia; may be more common in patients receiving linezolid for >2 weeks], lactic acidosis; peripheral or optic neuropathy) on a regular basis. Teach patient proper use (oral), possible side effects/appropriate interventions (eg, tyramine-free diet; see Tyramine Contents of Foods list), and adverse symptoms to report.

Monitoring: Lab TestsWeekly CBC and platelet counts, particularly in patients at increased risk of bleeding, with pre-existing myelosuppression, on concomitant medications that cause bone marrow suppression, in those who require >2 weeks of therapy, or in those with chronic infection who have received previous or concomitant antibiotic therapy.

Patient EducationOral: Take exactly as directed. Suspension; store at room temperature and use within 21 days. Do not alter dosage without consulting prescriber. Complete full course of therapy even if condition appears controlled. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid alcohol. Avoid tyramine-containing foods (eg, pickles, aged cheese, wine).

Oral/I.V.: You may experience mild headache (analgesic may help); GI discomfort, nausea, vomiting, taste alteration (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or constipation (increase exercise, fluids, fruit, or fiber may help). Report immediately unresolved, white plaques in mouth; skin rash or irritation; acute headache, dizziness, blurred vision, or changes in visual acuity; tingling or numbness in extremities; persistent diarrhea; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed]:

Zyvox®: 200 mg (100 mL) [contains sodium 1.7 mEq]; 600 mg (300 mL) [contains sodium 5 mEq]

Powder for oral suspension:

Zyvox®: 20 mg/mL (150 mL) [contains phenylalanine 20 mg/5 mL, sodium benzoate, and sodium 0.4 mEq/5 mL; orange flavor]

Tablet:

Zyvox®: 600 mg [contains sodium 0.1 mEq/tablet]

Generic AvailableNo

ManufacturerPharmacia

Pricing: U.S. (www.drugstore.com)

Tablets (Zyvox)

600 mg (20): $1642.39

Mechanism of ActionInhibits bacterial protein synthesis by binding to bacterial 23S ribosomal RNA of the 50S subunit. This prevents the formation of a functional 70S initiation complex that is essential for the bacterial translation process. Linezolid is bacteriostatic against enterococci and staphylococci and bactericidal against most strains of streptococci.

Pharmacodynamics/Kinetics

Absorption: Rapid and extensive

Distribution: V_{dss}: Adults: 40-50 L

Protein binding: Adults: 31%

Metabolism: Hepatic via oxidation of the morpholine ring, resulting in two inactive metabolites (aminoethoxyacetic acid, hydroxyethyl glycine); does not involve CYP

Bioavailability: Oral: ~100%

Half-life elimination: Children ≥1 week (full-term) to 11 years: 1.5-3 hours; Adults: 4-5 hours

Time to peak: Adults: Oral: 1-2 hours

Excretion: Urine (30% as parent drug, 50% as metabolites); feces (9% as metabolites)

Nonrenal clearance: ~65%; increased in children ≥1 week to 11 years

Related Information

- Tyramine Content of Foods

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral moniliasis, taste alteration, and tongue discoloration.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsLinezolid has mild monoamine oxidase inhibitor properties. The clinician is reminded that vasoconstrictors have the potential to interact with MAO-Is to result in elevation of blood pressure. Caution is suggested.

Mental Health: Effects on Mental StatusMay cause insomnia and dizziness

Mental Health: Effects on Psychiatric TreatmentHas mild MAO inhibitor properties and has the potential to have the same interactions as other MAO inhibitors; thrombocytopenia has been reported and may be dependent on duration of therapy (generally >2 weeks of treatment), caution with valproic acid; avoid use with serotonergic agents such as TCAs, venlafaxine, trazodone, sibutramine, meperidine, dextromethorphan, and SSRIs; may cause leukopenia, use caution with clozapine and carbamazepine

Cardiovascular ConsiderationsLinezolid has mild MAO inhibitor properties and should be used with caution in patients with cardiovascular disease, particularly those with hypertension. Avoid use with sympathomimetic and dopaminergic agents. Linezolid can cause thrombocytopenia. Use cautiously in patients with thrombocytopenia, or in patients being started on medications that can cause thrombocytopenia (eg, heparin).

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Linezolid has mild MAO inhibitor properties and should be used with caution in patients with cardiovascular disease, particularly those with hypertension. Avoid use with sympathomimetic and dopaminergic agents (serotonin reuptake inhibitors, tricyclic antidepressants, serotonin 5-HT_1 receptor agonists, meperidine, or buspirone).

Linezolid has time-dependent kill characteristics; time for which the serum concentration remains above the MIC for a dosing period is the best predictor of efficacy. With prolonged exposure (>2 weeks), monitor closely for anemia, leukopenia, and thrombocytopenia.

Evidence-Based Information:

Trial Showing Increased Rate of Death in Catheter-Related Bloodstream Infections - March, 2007: The U.S. Food and Drug Administration (FDA) has issued an alert to healthcare professionals regarding an increased rate of death among patients treated with linezolid (Zyvox®) for catheter-related bacteremia and catheter-site infections. Healthcare professionals are reminded that linezolid is not approved for the treatment of catheter-related bloodstream, catheter-site, or gram-negative infections. Additional information is available at http://www.fda.gov/medwatch/safety/2007/safety07.htm#zyvox

Pharmacologic Category[Chemotherapy Regimen, Leukemia, Acute Lymphocytic]

Regimen UseLeukemia, acute lymphocytic

Regimen

Remission induction:

Daunorubicin: I.V.: 50 mg/m^2/day days 1, 2, and 3

[total dose/cycle = 150 mg/m^2]

Vincristine: I.V.: 2 mg/day days 1, 8, 15, and 22

[total dose/cycle = 8 mg]

Prednisone: Oral: 60 mg/m^2/day days 1 to 28

[total dose/cycle = 1680 mg/m^2]

Asparaginase: I.M.: 6000 units/m^2/day days 17 to 28

[total dose/cycle = 72,000 units/m^2]

If residual leukemia in bone marrow on day 14:

Daunorubicin: I.V.: 50 mg/m^2 day 15

[total dose/cycle = 50 mg/m^2]

If residual leukemia in bone marrow on day 28:

Daunorubicin: I.V.: 50 mg/m^2/day days 29 and 30

[total dose/cycle = 100 mg/m^2]

Vincristine: I.V.: 2 mg/day days 29 and 36

[total dose/cycle = 4 mg]

Prednisone: Oral: 60 mg/m^2/day days 29 to 42

[total dose/cycle = 840 mg/m^2]

Asparaginase: I.M.: 6000 units/m^2/day days 29 to 35

[total dose/cycle = 42,000 units/m^2]

Consolidation therapy:

Treatment A (cycles 1, 3, 5, and 7)

Daunorubicin: I.V.: 50 mg/m^2/day days 1 and 2

[total dose/cycle = 100 mg/m^2]

Vincristine: I.V.: 2 mg/day days 1 and 8

[total dose/cycle = 4 mg]

Prednisone: Oral: 60 mg/m^2/day days 1 to 14

[total dose/cycle = 840 mg/m^2]

Asparaginase: I.M.: 12,000 units/m^2/day days 2, 4, 7, 9, 11, and 14

[total dose/cycle = 72,000 units/m^2]

Treatment B (cycles 2, 4, 6, and 8)

Teniposide: I.V.: 165 mg/m^2/day days 1, 4, 8, and 11

[total dose/cycle = 660 mg/m^2]

Cytarabine: I.V.: 300 mg/m^2/day days 1, 4, 8, and 11

[total dose/cycle = 1200 mg/m^2]

Treatment C (cycle 9)

Methotrexate: I.V.: 690 mg/m^2 continuous infusion day 1 (over 42 hours)

[total dose/cycle = 690 mg/m^2]

Leucovorin: I.V.: 15 mg/m^2 every 6 hours for 12 doses (start at end of methotrexate infusion)

[total dose/cycle = 180 mg/m^2]

Administer remission induction regimen for one cycle only. Repeat consolidation cycle every 28 days.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Liothyronine may be confused with levothyroxine

T3 is an error-prone abbreviation (mistaken as acetaminophen and codeine [ie, Tylenol® #3])

Pronunciation(lye oh THYE roe neen)

U.S. Brand NamesCytomel®; Triostat®

Canadian Brand NamesCytomel®

Pharmacologic CategoryThyroid Product

Use: Labeled Indications

Oral: Replacement or supplemental therapy in hypothyroidism; management of nontoxic goiter; a diagnostic aid

I.V.: Treatment of myxedema coma/precoma

Dosing: Adults

Hypothyroidism: Oral: 25 mcg/day increase by 12.5-25 mcg/day every 1-2 weeks to a maximum of 100 mcg/day; usual maintenance dose: 25-75 mcg/day

Patients with cardiovascular disease: Refer to elderly dosing.

Suppression test: (T_3): Oral: 75-100 mcg/day for 7 days; use lowest dose for elderly

Myxedema: Oral: Initial: 5 mcg/day; increase in increments of 5-10 mcg/day every 1-2 weeks. When 25 mcg/day is reached, dosage may be increased at intervals of 5-25 mcg/day every 1-2 weeks. Usual maintenance dose: 50-100 mcg/day.

Myxedema coma: I.V.: 25-50 mcg

Patients with known or suspected cardiovascular disease: 10-20 mcg

Note: Normally, at least 4 hours should be allowed between doses to adequately assess therapeutic response and no more than 12 hours should elapse between doses to avoid fluctuations in hormone levels. Oral therapy should be resumed as soon as the clinical situation has been stabilized and the patient is able to take oral medication. If levothyroxine rather than liothyronine sodium is used in initiating oral therapy, the prescriber should bear in mind that there is a delay of several days in the onset of levothyroxine activity and that I.V. therapy should be discontinued gradually.

Simple (nontoxic) goiter: Oral: Initial: 5 mcg/day; increase by 5-10 mcg every 1-2 weeks; after 25 mcg/day is reached, may increase dose by 12.5-25 mcg. Usual maintenance dose: 75 mcg/day.

Dosing: ElderlyOral: 5 mcg/day; increase by 5 mcg/day every 2 weeks

Dosing: PediatricCongenital hypothyroidism: Oral: 5 mcg/day increase by 5 mcg every 3-4 days until the desired response is achieved. Usual maintenance dose: 20 mcg/day for infants, 50 mcg/day for children 1-3 years of age, and adult dose for children >3 years.

Administration: I.V.For I.V. use only; **do not administer I.M. or SubQ.** Administer doses at least 4 hours, and no more than 12 hours, apart. Resume oral therapy as soon as the clinical situation has been stabilized and the patient is able to take oral medication. If **levothyroxine** is used for oral therapy, there is a delay of several days in the onset of activity; therefore, discontinue I.V. therapy gradually.

Administration: OralWhen switching to tablets, discontinue the injectable, initiate oral therapy at a low dosage, and increase gradually according to response.

StorageVials must be stored under refrigeration at 2°C to 8°C (36°F to 46°F). Store tablets at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to liothyronine sodium or any component of the formulation; undocumented or uncorrected adrenal insufficiency; recent myocardial infarction or thyrotoxicosis; artificial rewarming (injection)

Warnings/Precautions

Boxed warnings:

- Weight reduction: See “Other warnings/precautions” below.

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency; symptoms may be exaggerated or aggravated.

- Cardiovascular disease: Use with caution and reduce dosage in patients with angina pectoris or other cardiovascular disease; chronic hypothyroidism predisposes patients to coronary artery disease.

- Diabetes: Use with caution in patients with diabetes mellitus and insipidus; symptoms may be exaggerated or aggravated.

- Myxedema: Use with caution in patients with myxedema; symptoms may be exaggerated or aggravated.

Special populations:

- Elderly: Use with caution in elderly patients; they may be more likely to have compromised cardiovascular function.

Other warnings/precautions:

- Monitoring: Thyroid replacement requires periodic assessment of thyroid status.

- Weight reduction: **[U.S. Boxed Warning]: Thyroid supplements are ineffective and potentially toxic for weight reduction. High doses may produce serious or even life-threatening toxic effects particularly when used with some anorectic drugs.**

Geriatric ConsiderationsElderly do not have a change in serum thyroxine associated with aging; however, plasma T_3 concentrations are decreased 25% to 40% in the elderly. There is not a compensatory rise in thyrotropin suggesting that lower T_3 is not reacted upon as a deficiency by the pituitary. This indicates a slightly lower than normal dosage of thyroid hormone replacement is usually sufficient in elderly patients than in younger adult patients. TSH must be monitored since insufficient thyroid replacement (elevated TSH) is a risk for coronary artery disease and excessive replacement (low TSH) may cause signs of hyperthyroidism and excessive bone loss.

Pregnancy Risk FactorA

Pregnancy ConsiderationsUntreated hypothyroidism may have adverse effects on fetal growth and development, and is associated with higher rate of complications; treatment should not be discontinued during pregnancy.

LactationEnters breast milk (small amounts)/compatible

Adverse Reactions

1% to 10%: Cardiovascular: Arrhythmia (6%), tachycardia (3%), cardiopulmonary arrest (2%), hypotension (2%), MI (2%)

<1%: Allergic skin reactions, angina, CHF, fever, hypertension, phlebitis, twitching

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Thyroid Products. *Risk C: Monitor therapy*

CarBAMazepine: May decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Estrogen Derivatives: May diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Thyroid Products. Phenytoin may also displace thyroid hormones from protein binding sites. *Risk C: Monitor therapy*

Rifampin: May decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Sodium Iodide I131: Thyroid Products may diminish the therapeutic effect of Sodium Iodide I131. *Risk X: Avoid combination*

Theophylline Derivatives: Thyroid Products may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Thyroid Products may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Monitoring ParametersT_3, TSH, heart rate, blood pressure, renal function, clinical signs of hypo- and hyperthyroidism; TSH is the most reliable guide for evaluating adequacy of thyroid replacement dosage. TSH may be elevated during the first few months of thyroid replacement despite patients being clinically euthyroid. In cases where T_4 remains low and TSH is within normal limits, an evaluation of "free" (unbound) T_4 is needed to evaluate further increase in dosage.

Reference RangeFree T_3, serum: 250-390 pg/dL; TSH: 0.4 and up to 10 (≥80 years) mIU/L; remains normal in pregnancy

Nursing: Physical Assessment/MonitoringSee Contraindications, Warnings/Precautions, and Dosing for use cautions. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (see extensive list of Drug Interactions). See I.V. Administration. Assess results of laboratory tests (see above), therapeutic effectiveness, and adverse effects (eg, hypo-/hyperthyroidism - see Adverse Reactions and Overdose/Toxicology) regularly during therapy. **Important:** See Effects on Lab Values above when considering results of thyroid function tests. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report (see Patient Education).

Monitoring: Lab TestsT_3, T_4, TSH. TSH may be elevated during the first few months of thyroid replacement despite patients being clinically euthyroid. In cases where T_4 remains low and TSH is within normal limits, an evaluation of "free" (unbound) T_4 is needed to evaluate further increase in dosage.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Thyroid replacement therapy is generally for life. Take as directed, in the morning before breakfast. Do not take antacids or iron preparations within 8 hours of thyroid medication. Do not discontinue without consulting prescriber. Report chest pain, rapid heart rate, palpitations, excessive sweating or heat intolerance, excessive sweating, increased nervousness, agitation, or lethargy.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 10 mcg/mL (1 mL)

Triostat®: 10 mcg/mL (1 mL) [contains ethanol 6.8%]

Tablet, oral:

Cytomel®: 5 mcg, 25 mcg, 50 mcg

Generic AvailableYes: Injection
ManufacturerMonarch Pharmaceuticals (distributor)
Pricing: U.S. (www.drugstore.com)

Tablets (Cytomel)

5 mcg (100): $78.95

25 mcg (100): $101.66

50 mcg (100): $152.49

Mechanism of ActionExact mechanism of action is unknown; however, it is believed the thyroid hormone exerts its many metabolic effects through control of DNA transcription and protein synthesis; involved in normal metabolism, growth, and development; promotes gluconeogenesis, increases utilization and mobilization of glycogen stores, and stimulates protein synthesis, increases basal metabolic rate
Pharmacodynamics/Kinetics

Onset of action: 2-4 hours

Peak response: 2-3 days

Absorption: Oral: Well absorbed (95% in 4 hours)

Half-life elimination: 2.5 days

Excretion: Urine

Pharmacotherapy PearlsEquivalent doses: The following statement on relative potency of thyroid products is included in a joint statement by American Thyroid Association (ATA), American Association of Clinical Endocrinologists (AACE) and The Endocrine Society (TES): For purposes of conversion, levothyroxine sodium (T_4) 100 mcg is usually considered equivalent to desiccated thyroid 60 mg, thyroglobulin 60 mg, or liothyronine sodium (T_3) 25 mcg. However, these are rough guidelines only and do not obviate the careful re-evaluation of a patient when switching thyroid hormone preparations, including a change from one brand of levothyroxine to another. Joint position statement is available at http://www.thyroid.org/professionals/advocacy/04_12_08_thyroxine.html.

A synthetic form of *L*-Triiodothyronine (T_3) can be used in patients allergic to products derived from pork or beef.

Note: Several medications have effects on thyroid production or conversion. The impact in thyroid replacement has not been specifically evaluated, but patient response should be monitored:

Methimazole: Decreases thyroid hormone secretion, while propylthiouracil decrease thyroid hormone secretion and decreases conversion of T_4 to T_3.

Beta-adrenergic antagonists: Decrease conversion of T_4 to T_3 (dose related, propranolol ≥160 mg/day); patients may be clinically euthyroid.

Iodide, iodine-containing radiographic contrast agents may decrease thyroid hormone secretion; may also increase thyroid hormone secretion, especially in patients with Graves' disease.

Other agents reported to impact on thyroid production/conversion include aminoglutethimide, amiodarone, chloral hydrate, diazepam, ethionamide, interferon-alpha, interleukin-2, lithium, lovastatin (case report), glucocorticoids (dose-related), mercaptopurine, sulfonamides, thiazide diuretics, and tolbutamide.

In addition, a number of medications have been noted to cause transient depression in TSH secretion, which may complicate interpretation of monitoring tests for thyroid hormones, including corticosteroids, octreotide, and dopamine. Metoclopramide may increase TSH secretion.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo precautions with vasoconstrictor are necessary if patient is well controlled with liothyronine
Mental Health: Effects on Mental StatusMay cause nervousness or insomnia
Mental Health: Effects on Psychiatric TreatmentUsed to augment antidepressants
Anesthesia and Critical Care Concerns/Other ConsiderationsEquivalent doses: The following statement on relative potency of thyroid products is included in a joint statement by American Thyroid Association (ATA), American Association of Clinical Endocrinologists (AACE) and The Endocrine Society (TES): For purposes of conversion, levothyroxine sodium (T_4) 100 mcg is usually considered equivalent to desiccated thyroid 60 mg, thyroglobulin 60 mg, or liothyronine sodium (T_3) 25 mcg. However, these are rough guidelines only and do not obviate the careful re-evaluation of a patient when switching thyroid hormone preparations, including a change from one brand of levothyroxine to another. Joint position statement is available at http://www.thyroid.org/professionals/advocacy/04_12_08_thyroxine.html.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Liotrix may be confused with Klotrix®

Thyrolar® may be confused with Thyrogen®, Thytropar®

Pronunciation(LYE oh triks)

U.S. Brand NamesThyrolar®

Canadian Brand NamesThyrolar®

Pharmacologic CategoryThyroid Product

Use: Labeled IndicationsReplacement or supplemental therapy in hypothyroidism (uniform mixture of T_4:T_3 in 4:1 ratio by weight); little advantage to this product exists and cost is not justified

Dosing: AdultsHypothyroidism (dose of thyroid equivalent): Oral: 30 mg/day (15 mg/day if cardiovascular impairment), increasing by increments of 15 mg/day at 2- to 3-week intervals to a maximum of 180 mg/day (usual maintenance dose: 60-120 mg/day)

Dosing: ElderlyInitial: 15 mg, adjust dose at 2- to 4-week intervals by increments of 15 mg

Dosing: PediatricCongenital hypothyroidism: Oral:

Children (dose of T_4 or levothyroxine/day):

0-6 months: 8-10 mcg/kg or 25-50 mcg/day

6-12 months: 6-8 mcg/kg or 50-75 mcg/day

1-5 years: 5-6 mcg/kg or 75-100 mcg/day

6-12 years: 4-5 mcg/kg or 100-150 mcg/day

>12 years: 2-3 mcg/kg or >150 mcg/day

StorageStore at 2°C to 8°C (36°F to 46°F). Protect from light.

ContraindicationsHypersensitivity to liotrix or any component of the formulation; recent myocardial infarction or thyrotoxicosis, uncomplicated by hypothyroidism; uncorrected adrenal insufficiency, hypersensitivity to active or extraneous constituents

Warnings/Precautions

Boxed warnings:

- Weight reduction: See “Other warnings/precautions” below.

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency; symptoms may be exaggerated or aggravated.
- Cardiovascular disease: Use with caution and reduce dosage in patients with angina pectoris or other cardiovascular disease; chronic hypothyroidism predisposes patients to coronary artery disease.
- Diabetes: Use with caution in patients with diabetes mellitus and insipidus; symptoms may be exaggerated or aggravated.
- Myxedema: Use with caution in patients with myxedema; symptoms may be exaggerated or aggravated.

Special populations:

- Elderly: Use with caution in the elderly; since they may be more likely to have compromised cardiovascular function.

Other warnings/precautions:

- Weight reduction: **[U.S. Boxed Warning]: Thyroid supplements are ineffective and potentially toxic for weight reduction. High doses may produce serious or even life-threatening toxic effects particularly when used with some anorectic drugs.**

Geriatric ConsiderationsElderly do not have a change in serum thyroxine associated with aging; however, plasma T_3 concentrations are decreased 25% to 40% in older adults. There is not a compensatory rise in thyrotropin suggesting that lower T_3 is not reacted upon as a deficiency by the pituitary. This indicates a slightly lower than normal dosage of thyroid hormone replacement is usually sufficient in older patients than in younger adult patients. TSH must be monitored since insufficient thyroid replacement (elevated TSH) is a risk for coronary artery disease and excessive replacement (low TSH) may cause signs of hyperthyroidism and excessive bone loss.

Pregnancy Risk FactorA

Pregnancy ConsiderationsUntreated hypothyroidism may have adverse effects on fetal growth and development, and is associated with higher rate of complications; treatment should not be discontinued during pregnancy.

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac arrhythmia, chest pain, palpitation, tachycardia

Central nervous system: Ataxia, fever, headache, insomnia, nervousness

Dermatologic: Alopecia

Endocrine & metabolic: Changes in menstrual cycle, increased appetite, weight loss

Gastrointestinal: Abdominal cramps, constipation, diarrhea, vomiting

Neuromuscular & skeletal: Hand tremor, myalgia, tremor

Respiratory: Dyspnea

Miscellaneous: Allergic skin reactions (rare), diaphoresis

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Thyroid Products. *Risk C: Monitor therapy*

CarBAMazepine: May decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Estrogen Derivatives: May diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Thyroid Products. Phenytoin may also displace thyroid hormones from protein binding sites. *Risk C: Monitor therapy*

Rifampin: May decrease the serum concentration of Thyroid Products. *Risk C: Monitor therapy*

Sodium Iodide I131: Thyroid Products may diminish the therapeutic effect of Sodium Iodide I131. *Risk X: Avoid combination*

Theophylline Derivatives: Thyroid Products may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Thyroid Products may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsMany drugs may have effects on thyroid function tests; para-aminosalicylic acid, aminoglutethimide, amiodarone, barbiturates, carbamazepine, chloral hydrate, clofibrate, colestipol, corticosteroids, danazol, diazepam, estrogens, ethionamide, fluorouracil, I.V. heparin, insulin, lithium, methadone, methimazole, mitotane, nitroprusside, oxyphenbutazone, phenylbutazone, PTU, perphenazine, phenytoin, propranolol, salicylates, sulfonylureas, and thiazides

Monitoring ParametersT_4, TSH, heart rate, blood pressure, clinical signs of hypo- and hyperthyroidism; TSH is the most reliable guide for evaluating adequacy of thyroid replacement dosage. TSH may be elevated during the first few months of thyroid replacement despite patients being clinically euthyroid. In cases where T_4 remains low and TSH is within normal limits, an evaluation of “free” (unbound) T_4 is needed to evaluate further increase in dosage.

Reference Range

TSH: 0.4-10 (for those ≥80 years) mIU/L

T_4: 4-12 mcg/dL (SI: 51-154 nmol/L)

T_3 (RIA) (total T_3): 80-230 ng/dL (SI: 1.2-3.5 nmol/L)

T_4 free (Free T_4): 0.7-1.8 ng/dL (SI: 9-23 pmol/L)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

$^1/_4$ [levothyroxine sodium 12.5 mcg and liothyronine sodium 3.1 mcg]

$^1/_2$ [levothyroxine sodium 25 mcg and liothyronine sodium 6.25 mcg]

1 [levothyroxine sodium 50 mcg and liothyronine sodium 12.5 mcg]

2 [levothyroxine sodium 100 mcg and liothyronine sodium 25 mcg]

3 [levothyroxine sodium 150 mcg and liothyronine sodium 37.5 mcg]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Thyrolar-1)

60 (12.5-50) mg (mcg) (30): $29.99

Tablets (Thyrolar-1/2)

30 (6.25-25) mg (mcg) (30): $26.99

Tablets (Thyrolar-1/4)

15 (3.1-12.5) mg (mcg) (30): $23.99

Tablets (Thyrolar-2)

120 (25-100) mg (mcg) (30): $32.99

Tablets (Thyrolar-3)

180 (73.5-150) mg (mcg) (30): $39.99

Mechanism of ActionThe primary active compound is T_3 (triiodothyronine), which may be converted from T_4 (thyroxine) and then circulates throughout the body to influence growth and maturation of various tissues. Liotrix is uniform mixture of synthetic T_4 and T_3 in 4:1 ratio; exact mechanism of action is unknown; however, it is believed the thyroid hormone exerts its many metabolic effects through control of DNA transcription and protein synthesis; involved in normal metabolism, growth, and development; promotes gluconeogenesis, increases utilization and mobilization of glycogen stores and stimulates protein synthesis, increases basal metabolic rate

Pharmacodynamics/Kinetics

Absorption: 50% to 95%

Metabolism: Partially hepatic, renal, and in intestines

Half-life elimination: 6-7 days

Time to peak, serum: 12-48 hours

Excretion: Partially feces (as conjugated metabolites)

Pharmacotherapy PearlsEquivalent doses: The following statement on relative potency of thyroid products is included in a joint statement by American Thyroid Association (ATA), American Association of Clinical Endocrinologists (AACE) and The Endocrine Society (TES): For purposes of conversion, levothyroxine sodium (T_4) 100 mcg is usually considered equivalent to desiccated thyroid 60 mg, thyroglobulin 60 mg, or liothyronine sodium (T_3) 25 mcg. However, these are rough guidelines only and do not obviate the careful re-evaluation of a patient when switching thyroid hormone preparations, including a change from one brand of levothyroxine to another. Joint position statement is available at http://www.thyroid.org/professionals/advocacy/04_12_08_thyroxine.html.

Since T_3 is produced by monodeiodination of T_4 in peripheral tissues (80%) and since elderly have decreased T_3 (25% to 40%), little advantage to this product exists and cost is not justified; no advantage over synthetic levothyroxine sodium.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo precautions with vasoconstrictor are necessary if patient is well controlled with liotrix

Mental Health: Effects on Mental StatusMay cause nervousness or insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsSince T_3 is produced by monodeiodination of T_4 in peripheral tissues (80%) and since elderly have decreased T_3 (25% to 40%), little advantage to this product exists and cost is not justified. Its use has no advantage over synthetic levothyroxine sodium.

Equivalent doses: The following statement on relative potency of thyroid products is included in a joint statement by American Thyroid Association (ATA), American Association of Clinical Endocrinologists (AACE) and The Endocrine Society (TES): For purposes of conversion, levothyroxine sodium (T_4) 100 mcg is usually considered equivalent to desiccated thyroid 60 mg, thyroglobulin 60 mg, or liothyronine sodium (T_3) 25 mcg. However, these are rough guidelines only and do not obviate the careful re-evaluation of a patient when switching thyroid hormone preparations, including a change from one brand of levothyroxine to another. Joint position statement is available at http://www.thyroid.org/professionals/advocacy/04_12_08_thyroxine.html.

Special Alerts

Medications for ADHD: AHA Clarification of Cardiovascular Screening Recommendation - May 2008

In an effort to reduce the rate of sudden cardiac death, especially in pediatric patients receiving stimulant medications for the treatment of attention-deficit/hyperactivity disorder (ADHD), the American Heart Association (AHA) has issued a statement in April 2008 recommending that all children diagnosed with ADHD who may be candidates for stimulant medications have a thorough cardiovascular assessment prior to initiation of drug therapy. The AHA scientific statement was issued by the Council on Cardiovascular Disease in the Young Congenital Cardiac Defects Committee and the Council on Cardiovascular Nursing. On May 16, 2008, the AHA issued a clarification of the recommendations due to the language regarding ECG recommendations and subsequent interpretations.

These recommendations are based on the Food and Drug Administration (FDA) reports of serious cardiovascular adverse events (including sudden death) in patients (both children and adults) taking usual doses of stimulant medications. Most of these patients were found to have underlying structural heart disease (eg, hypertrophic obstructive cardiomyopathy). In 2006, these reports prompted the FDA to recommend labeling changes of these medications to include warnings about cardiovascular events and to develop patient medication guides to be distributed with each prescription.

Stimulant medications theoretically increase cardiovascular risk due to potential effects on blood pressure elevation and increased heart rate. These effects have generally been considered clinically insignificant in most children, however, may be detrimental in certain patients with underlying cardiovascular disease. None of the medications have been shown to cause heart conditions or proven to have caused sudden cardiac death.

The committee suggests that patients needing the following ADHD medications receive a thorough cardiovascular assessment: Methylphenidate, amphetamine, dextroamphetamine, atomoxetine, clonidine, guanfacine, desipramine, imipramine, bupropion, and modafinil.

According to the clarified AHA recommendations, this assessment should include a combination of thorough medical history, family history, and physical examination with the intent to identify risk factors for sudden death. Although not mandatory, physicians should consider obtaining an ECG.

Patients already maintained on ADHD medications should not stop taking their medication. Instead, patients or their caregivers should contact their healthcare provider. It is reasonable that these patients undergo a similar cardiovascular assessment without interruption of therapy.

Press releases and clarified recommendations from the AHA note that the intent of this statement is not to reduce appropriate use of these medications, but to provide physicians with useful tools to identify heart conditions in children with ADHD in order to make more informed prescribing decisions. ECG testing is recommended as one option to be used as part of a combination screening process. They do suggest that a lack of ECG testing should not necessarily mean that treatment not be initiated.

The clarified statement has been endorsed by the American Academy of Child and Adolescent Psychiatry, the American College of Cardiology, Children and Adults with Attention-Deficit/Hyperactivity Disorder, and the National Initiative for Children's Healthcare Quality.

Medication Safety Issues

Sound-alike/look-alike issues:

Vyvanse™ may be confused with Vytorin®, Glucovance®, Vivactil®

Pronunciation(lis dex am FET a meen)
U.S. Brand NamesVyvanse™
Pharmacologic CategoryStimulant
Use: Labeled IndicationsTreatment of attention-deficit/hyperactivity disorder (ADHD)
Dosing: AdultsADHD: Oral: Initial: 30 mg once daily in the morning; may increase in increments of 10 mg or 20 mg/day at weekly intervals until optimal response is obtained; maximum: 70 mg/day

Note: Individualize dosage based on patient need and response to therapy. Administer at the lowest effective dose.

Dosing: PediatricADHD: Oral: Children: 6-12 years: Initial: 30 mg once daily in the morning; may increase in increments of 10 mg or 20 mg/day at weekly intervals until optimal response is obtained; maximum: 70 mg/day

Note: Individualize dosage based on patient need and response to therapy. Administer at the lowest effective dose.

Administration: OralAdminister in the morning with or without food; swallow capsule whole, do not chew; capsule may be opened and the contents dissolved in glass of water; consume the resulting solution immediately; do not store solution.
Dietary ConsiderationsMay be taken with or without food.
StorageStore at controlled room temperature of 25°C (77°F) excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.
RestrictionsC-II

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsKnown hypersensitivity or idiosyncratic reaction sympathomimetic amines; advanced arteriosclerosis, symptomatic cardiovascular disease, moderate-to-severe hypertension; hyperthyroidism; glaucoma; agitated states; history of drug abuse; concurrent use or within 2 weeks of use of MAO inhibitors
Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Drug abuse: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Cardiovascular events: **[U.S. Boxed Warning]: Use of CNS stimulants has been associated with serious cardiovascular events, including sudden death in patients with pre-existing structural cardiac abnormalities or other serious heart problems (sudden death in children and adolescents; sudden death, stroke and MI in adults).** These products should be avoided in the patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, coronary artery disease (adults), or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry. Patients should be carefully evaluated for these cardiac disorders prior to initiation of therapy.
- CNS effects: Amphetamines may impair the ability to engage in potentially hazardous activities.
- Visual disturbance: Difficulty in accommodation and blurred vision has been reported with the use of stimulants.

Disease-related concerns:

- ADHD treatment: Appropriate use: Recommended to be used as part of a comprehensive treatment program for attention deficit disorders.
- Drug abuse: **[U.S. Boxed Warning]: Potential for drug dependency exists; prolonged use may lead to drug dependency.** Use is contraindicated in patients with history of ethanol or drug abuse. Prescriptions should be written for the smallest quantity consistent with good patient care to minimize possibility of overdose.
- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate. Use is contraindicated in patients with moderate-to-severe hypertension, arteriosclerosis, hyperthyroidism, or symptomatic CVD.
- Psychiatric disorders: Use with caution in patients with pre-existing psychosis, bipolar disorder (may induce mixed/manic episode), aggressive behavior, or hostility. May exacerbate symptoms of behavior and thought disorder in psychotic patients; new onset psychosis or mania may occur with stimulant use; observe for symptoms of aggression and/or hostility.

- Seizure disorder: Use with caution in patients with a history of seizure disorder; may lower seizure threshold leading to new onset or breakthrough seizure activity.

- Tourette's syndrome/tics: Use with caution in patients with Tourette's syndrome; stimulants may exacerbate tics (motor and phonic) and Tourette’s syndrome. Evaluate for tics and Tourette’s syndrome prior to therapy initiation.

Special populations:

- Pediatrics: Safety and efficacy in children <6 years of age or children >12 years of age have not been established. Amphetamines are not recommended in children <3 years of age. Appetite suppression may occur; monitor weight during therapy, particularly in children. Use of stimulants has been associated with slowing of growth rate; monitor growth rate during treatment. Treatment interruption may be necessary in patients who are not growing or gaining weight as expected.

Other warnings/precautions:

- Discontinuation of therapy: Abrupt discontinuation following high doses or for prolonged periods may result in symptoms for withdrawal.

- Long-term use: Safety and efficacy of long-term use have not yet been established.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have shown that amphetamines may cause embryotoxic and teratogenic effects and that pre- or early postnatal exposure to amphetamines may lead to lasting changes in behavior, including impaired learning, memory, and motor skills, as well as changes to libido. There are no adequate and well-controlled studies in pregnant women. No reproductive studies have been performed with lisdexamfetamine. Infants born to mothers dependent on amphetamines are more likely to arrive prematurely with low birth weight and may experience withdrawal symptoms including irritation, restlessness, anxiousness, weakness, listlessness, or lethargy.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsManufacturer advises nursing mothers taking amphetamines to refrain from breast-feeding.

Adverse Reactions

>10%:

Central nervous system: Headache (children 12%), insomnia (19% to 27%; 4% [initially])

Gastrointestinal: Appetite decreased (27% to 39%), xerostomia (children 5%; adults 26%), abdominal pain (children 12%)

1% to 10%:

Cardiovascular: Blood pressure increased (adults 3%), heart rate increased (adults 2%)

Central nervous system: Irritability (children 10%), anxiety (adults 6%), dizziness (children 5%), jitteriness (adults 4%), affect lability (children 3%), agitation (adults 3%), restlessness (adults 3%), fever (children 2%), somnolence (children 2%), tic (children 2%)

Dermatologic: Hyperhidrosis (adults 3%), rash (children 3%)

Gastrointestinal: Vomiting (children 9%), weight loss (children 9%), diarrhea (adults 7%), nausea (6% to 7%), anorexia (adult: 5%)

Neuromuscular & skeletal: Tremor (adults 2%)

Respiratory: Dyspnea (adults 2%)

Additional adverse reaction associated with amphetamines; frequency not defined.

Cardiovascular: Cardiomyopathy, hypertension, MI, palpitation, sudden death, tachycardia

Central nervous system: Depression, dyskinesia, dysphoria, euphoria, exacerbation of motor and phonic tics, Tourette's syndrome, overstimulation, psychotic episodes, seizure, stroke

Dermatologic: Angioedema, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Libido changes

Gastrointestinal: Abnormal taste, constipation

Genitourinary: Impotence

Miscellaneous: Anaphylaxis

Drug Interactions

Alkalinizing Agents: May decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Ammonium Chloride: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Analgesics (Opioid): Amphetamines may enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Antihistamines: Amphetamines may diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antipsychotics: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Amphetamines. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Ethosuximide: Amphetamines may diminish the therapeutic effect of Ethosuximide. Amphetamines may decrease the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Gastrointestinal Acidifying Agents: May decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Methenamine: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

PHENobarbital: Amphetamines may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Amphetamines may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: High-fat meal prolongs T_{max} by ~1 hour.

Test InteractionsAmphetamines may interfere with urinary steroid determinations.

Monitoring ParametersCardiac evaluation should be completed on any patient who develops chest pain, unexplained syncope, and any symptom of cardiac disease during treatment with stimulants; growth and CNS activity in all patients

When used for the treatment of ADHD, thoroughly evaluate for cardiovascular risk. Monitor heart rate, blood pressure, and consider obtaining ECG prior to initiation (Vetter, 2008).

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Perform careful cardiovascular assessment prior to initiating therapy. Monitor weight and blood pressure at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed. Drug may cause physical and/or psychological dependence. Do not take any new medications without consulting prescriber. Avoid alcohol use. Use caution when driving or engaging in tasks requiring alertness until response to drug is known. May cause problems with sleeping, headache, irritability, dizziness, nausea, vomiting (small, frequent meals, frequent oral care, sucking lozenges, or chewing gum may help), abdominal pain, and decreased appetite. Report chest pain, shortness of breath, fainting, abnormal thinking or behavior, increased aggression, hallucinations, seizures, change in vision, or persistent abdominal pain.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage Forms

Capsule, as dimesylate:

Vyvanse™: 20 mg, 30 mg, 40 mg, 50 mg, 60 mg, 70 mg

Generic AvailableNo

ManufacturerShire

Pricing: U.S. (www.drugstore.com)

Capsules (Vyvanse)

20 mg (20): $102.71

30 mg (20): $103.02

50 mg (20): $95.01

70 mg (30): $137.38

Mechanism of ActionLisdexamfetamine dimesylate is a prodrug that is converted to the active component dextroamphetamine (a noncatecholamine, sympathomimetic amine); CNS stimulant effects are thought to result from the interference of norepinephrine and dopamine reuptake into presynaptic neurons as well as increasing their release from nerve terminals; inhibits the actions of monoamine oxidase; peripheral actions include increase in systolic and diastolic blood pressure as well as weak bronchodilator and respiratory stimulant action.

Pharmacodynamics/Kinetics

Absorption: Rapid

Distribution: Dextroamphetamine: V_d: Adults: 3.5-4.6 L/kg; distributes into CNS; mean CSF concentrations are 80% of plasma; enters breast milk

Metabolism: Non-CYP-mediated hepatic or intestinal metabolism to dextroamphetamine and l-lysine

Half-life elimination: Lisdexamfetamine: <1 hour; Dextroamphetamine: 10-13 hours

Time to peak, serum: T_{max}: Lisdexamfetamine: ~1 hour; Dextroamphetamine: ~3.5 hours

Excretion: Urine (96%, 42% as amphetamine-related compounds, 2% as lisdexamfetamine, 25% hippuric acid); feces (minimal)

Related Information

- Stimulant Agents Used for ADHD

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Lisdexamfetamine is a prodrug that is converted to the active component dextroamphetamine (a noncatecholamine, sympathomimetic amine); dextroamphetamine is known to increase blood pressure. Monitor blood pressure prior to using local anesthetic with vasoconstrictors.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution in patients taking lisdexamfetamine. Amphetamines enhance the sympathomimetic response of epinephrine or mepivacaine and levonordefrin (Carbocaine® 2% with Neo-Cobefrin®) leading to potential hypertension and cardiotoxicity.

Index TermsLisdexamfetamine Dimesylate; Lisdexamphetamine; NRP104

Lisinopril and Hydrochlorothiazide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(lyse IN oh pril & hye droe klor oh THYE a zide)

U.S. Brand NamesPrinzide®; Zestoretic®

Canadian Brand NamesApo-Lisinopril/Hctz; Gen-Lisinopril/Hctz; Novo-Lisinopril/Hctz; Prinzide®; Sandoz Lisinopril/Hctz; Zestoretic®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension

Dosing: AdultsHypertension: Oral: Initial: Lisinopril 10 mg/hydrochlorothiazide 12.5 mg or lisinopril 20 mg/hydrochlorothiazide 12.5 mg with further increases of either or both components could depend on clinical response. Doses >80 mg/day lisinopril or >50 mg/day hydrochlorothiazide are not recommended.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentDosage adjustments should be made with caution. Usual regimens of therapy need not be adjusted as long as patient's Cl_{cr} >30 mL/minute. In patients with more severe renal impairment, loop diuretics are preferred.

ContraindicationsHypersensitivity to lisinopril, any other ACE inhibitor, hydrochlorothiazide, sulfonamide-derived drugs, or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor; patients with idiopathic or hereditary angioedema; anuria

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use lisinopril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Hydrochlorothiazide can cause systemic lupus erythematosus (SLE) exacerbation or activation.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use fosinopril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use lisinopril with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective). Contraindicated in anuric patients.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy Considerations**[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.** See individual agents.
Lactation

Hydrochlorothiazide: Compatible

Lisinopril: Excretion in breast milk unknown

Breast-Feeding ConsiderationsSee individual monographs.
Adverse ReactionsSee individual agents.
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can

not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet: 10/12.5: Lisinopril 10 mg and hydrochlorothiazide 12.5 mg; 20/12.5: Lisinopril 20 mg and hydrochlorothiazide 12.5 mg; 20/25: Lisinopril 20 mg and hydrochlorothiazide 25 mg

Prinizide®:

- 10/12.5: Lisinopril 10 mg and hydrochlorothiazide 12.5 mg
- 20/12.5: Lisinopril 20 mg and hydrochlorothiazide 12.5 mg [DSC]
- 20/25: Lisinopril 20 mg and hydrochlorothiazide 25 mg

Zestoretic®:

- 10/12.5: Lisinopril 10 mg and hydrochlorothiazide 12.5 mg

Related Information

- Hydrochlorothiazide
- Lisinopril

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause sedation, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular ConsiderationsCombination therapy for the treatment of hypertension should be individualized for each patient. Potential advantages for lisinopril and hydrochlorothiazide combination therapy may include improved compliance and synergistic reductions in blood pressure with an accompanied reduction in side effects. ACE inhibitors and thiazides are also standard therapy for left ventricular systolic dysfunction. See Cardiovascular Considerations for individual agents.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lisinopril may be confused with fosinopril, Lioresal®, Risperdal®

Prinivil® may be confused with Plendil®, Pravachol®, Prevacid®, Prilosec®, Proventil®

Zestril® may be confused with Desyrel®, Restoril®, Vistaril®, Zetia®, Zostrix®

International issues:

Acepril® [Denmark] may be confused with Accupril® which is a brand name for quinapril in the U.S.

Acepril®: Brand name for enalapril in Hungary and Switzerland; brand name for captopril in Great Britain

Carace® [Ireland; Great Britain] may be confused with Carac™ which is a brand name for fluorouracil in the U.S.

Zestril® may be confused with Nostril® which is a brand name for chlorhexidine/cetrimonium in France

Pronunciation(lyse IN oh pril)

U.S. Brand NamesPrinivil®; Zestril®

Canadian Brand NamesApo-Lisinopril®; CO Lisinopril; Gen-Lisinopril; Novo-Lisinopril; PMS-Lisinopril; Prinivil®; Pro-Lisinopril; Ran-Lisinopril; ratio-Lisinopril; Riva-Lisinopril; Zestril®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension, either alone or in combination with other antihypertensive agents; adjunctive therapy in treatment of heart failure (HF); treatment of acute myocardial infarction (MI) within 24 hours in hemodynamically-stable patients to improve survival

Dosing: Adults

Hypertension: Oral: Usual dosage range (JNC 7): 10-40 mg/day

Not maintained on diuretic: Initial: 10 mg/day

Maintained on diuretic: Initial: 5 mg/day

Note: Antihypertensive effect may diminish toward the end of the dosing interval especially with doses of 10 mg/day. An increased dose may aid in extending the duration of antihypertensive effect. Doses up to 80 mg/day have been used, but do not appear to give greater effect.

Patients taking diuretics should have them discontinued 2-3 days prior to initiating lisinopril if possible. Restart diuretic after blood pressure is stable if needed. If diuretic cannot be discontinued prior to therapy, begin with 5 mg with close supervision until stable blood pressure. In patients with hyponatremia (<130 mEq/L), start dose at 2.5 mg/day.

Heart failure: Oral: Initial: 2.5-5 mg once daily; then increase by no more than 10 mg increments at intervals no less than 2 weeks to a maximum daily dose of 40 mg. Usual maintenance: 5-40 mg/day as a single dose. Target dose: 20-40 mg once daily (ACC/AHA 2005 Heart Failure Guidelines)

Note: If patient has hyponatremia (serum sodium <130 meq/L) or renal impairment (Cl_{cr} <30 mL/minute or creatinine >3 mg/dL), then initial dose should be 2.5 mg/day

Acute myocardial infarction (within 24 hours in hemodynamically stable patients): Oral: 5 mg immediately, then 5 mg at 24 hours, 10 mg at 48 hours, and 10 mg every day thereafter for 6 weeks. Patients should continue to receive standard treatments such as thrombolytics, aspirin, and beta-blockers.

Dosing: ElderlyOral:

Initial: 2.5-5 mg/day; increase doses 2.5-5 mg/day at 1- to 2-week intervals; maximum daily dose: 40 mg

Patients taking diuretics should have them discontinued 2-3 days prior to initiating lisinopril if possible. Restart diuretic after blood pressure is stable if needed. In patients with hyponatremia (<130 mEq/L), start dose at 2.5 mg/day (see Renal Impairment).

Dosing: Pediatric

Hypertension: Children ≥6 years: Oral: Initial: 0.07 mg/kg once daily (up to 5 mg); increase dose at 1- to 2-week intervals; doses >0.61 mg/kg or

>40 mg have not been evaluated.

Dosing: Renal Impairment

Hypertension:

Adults: Initial doses should be modified and upward titration should be cautious, based on response (maximum: 40 mg/day)

Cl_{cr} >30 mL/minute: Initial: 10 mg/day

Cl_{cr} 10-30 mL/minute: Initial: 5 mg/day

Hemodialysis: Initial: 2.5 mg/day; dialyzable (50%)

Children: Use in not recommended in pediatric patients with GFR <30 mL/minute/1.73 m^2

Heart failure: Adults: Cl_{cr} <30 mL/minute or creatinine >3 mg/dL): Initial: 2.5 mg/day

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralWatch for hypotensive effects within 1-3 hours of first dose or new higher dose.

Dietary ConsiderationsUse potassium-containing salt substitutes cautiously in patients with diabetes, patients with renal dysfunction, or those maintained on potassium supplements or potassium-sparing diuretics.

Extemporaneously Prepared**Preparation of oral suspension (1 mg/mL): Note:** Mix in a polyethylene terephthalate bottle. Add 10 mL of purified water (USP) to a bottle containing ten lisinopril 20 mg tablets (total 200 mg). Shake for at least 1 minute; then add 30 mL Bicitra® and 160 mL Ora-Sweet SF™ and shake gently to suspend contents. Store at 25°C (77°F); stable for up to 4 weeks.

ContraindicationsHypersensitivity to lisinopril or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor; patients with idiopathic or hereditary angioedema

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age or with a Cl_{cr} ≤30 mL/minute.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric Considerations Due to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors. Differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with congestive heart failure and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in the elderly and causes little or no CNS confusion. Use lowest dose recommendations initially. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk Factor C (1st trimester); D (2nd and 3rd trimesters)

Pregnancy Considerations Due to adverse events observed in some animal studies, lisinopril is considered pregnancy category C during the first trimester. Based on human data, lisinopril is considered pregnancy category D if used during the second and third trimesters (per the manufacturer; however, one study suggests that fetal injury may occur at anytime during pregnancy). Lisinopril crosses the placenta. First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus when used in the second and third trimesters. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

Lactation Excretion in breast milk unknown/not recommended

Breast-Feeding Considerations It is not known if lisinopril is excreted in breast milk. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Lisinopril in Pregnancy & Lactation

Adverse Reactions **Note:** Frequency ranges include data from hypertension and heart failure trials. Higher rates of adverse reactions have generally been noted in patients with CHF. However, the frequency of adverse effects associated with placebo is also increased in this population.

1% to 10%:

Cardiovascular: Orthostatic effects (1%), hypotension (1% to 4%)

Central nervous system: Headache (4% to 6%), dizziness (5% to 12%), fatigue (3%)

Dermatologic: Rash (1% to 2%)

Endocrine & metabolic: Hyperkalemia (2% to 5%)

Gastrointestinal: Diarrhea (3% to 4%), nausea (2%), vomiting (1%), abdominal pain (2%)

Genitourinary: Impotence (1%)

Hematologic: Decreased hemoglobin (small)

Neuromuscular & skeletal: Chest pain (3%), weakness (1%)

Renal: BUN increased (2%); deterioration in renal function (in patients with bilateral renal artery stenosis or hypovolemia); serum creatinine increased (often transient)

Respiratory: Cough (4% to 9%), upper respiratory infection (1% to 2%)

<1%: Acute renal failure, alopecia, anaphylactoid reactions, angioedema, anuria, arrhythmia, arthralgia, arthritis, asthma, ataxia, azotemia, bilirubin increased, bone marrow suppression, bronchospasm, cardiac arrest, cutaneous pseudolymphoma, decreased libido, gout, hemolytic anemia, hepatic necrosis, hepatitis, hyponatremia, leukopenia, jaundice (cholestatic), MI, neutropenia, oliguria, orthostatic hypotension, pancreatitis, paresthesia, pemphigus, peripheral neuropathy, photosensitivity, pleural effusion, pulmonary embolism, pulmonary infiltrates, SIADH, Stevens-Johnson syndrome, stroke, syncope, systemic lupus erythematosus, thrombocytopenia, TIA, toxic epidermal necrolysis, transaminases increased, tremor, urticaria, vasculitis, vertigo, vision loss, volume overload, vomiting, weight gain/loss, wheezing, xerostomia

In addition, a syndrome which may include fever, myalgia, arthralgia, interstitial nephritis, vasculitis, rash, eosinophilia, positive ANA, and elevated ESR has been reported with ACE inhibitors.

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Potassium-containing salt substitutes may increase risk of hyperkalemia.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Test InteractionsMay cause false-positive results in urine acetone determinations using sodium nitroprusside reagent

Monitoring ParametersBUN, serum creatinine, renal function, WBC, and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringAssess patient carefully for use cautions prior to beginning therapy. Assess potential for interactions with other pharmacological agents or herbal products patient is taking that may impact fluid balance or cardiac status. Patient should be monitored for adverse reactions following first dose, following any increase in dose and regularly during therapy (eg, angioedema that may potentially affect airway or intestine, hypovolemia, postural hypotension, or anaphylactic reaction). Evaluate results of laboratory tests and therapeutic effectiveness on a (normotensive) regular basis. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBUN, serum creatinine, renal function, WBC, and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not discontinue without consulting prescriber. Take first dose at bedtime. Take all doses on an empty stomach, 1 hour before or 2 hours after meals. Do not use potassium supplement or salt substitutes without consulting prescriber. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); or nausea, vomiting, abdominal pain, dry mouth, or transient loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help), report if these persist. Report chest pain or palpitations; mouth sores; fever or chills; swelling of extremities, face, mouth, or tongue; skin rash; numbness, tingling, or pain in muscles; respiratory difficulty or unusual cough; other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg

Prinivil®: 5 mg, 10 mg, 20 mg

Zestril®: 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Lisinopril)

2.5 mg (30): $12.99

5 mg (30): $14.89

10 mg (30): $12.99

20 mg (30): $13.99

30 mg (30): $20.99

40 mg (30): $17.99

Tablets (Prinivil)

2.5 mg (60): $42.99

5 mg (60): $65.99

20 mg (90): $104.51

Tablets (Zestril)

2.5 mg (30): $38.58

5 mg (30): $50.70

10 mg (30): $55.11

20 mg (30): $59.35

30 mg (30): $72.74

40 mg (30): $77.15

Mechanism of ActionCompetitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which causes an increase in plasma renin activity and a reduction in aldosterone secretion; a CNS mechanism may also be involved in hypotensive effect as angiotensin II increases adrenergic outflow from CNS; vasoactive kallikreins may be decreased in conversion to active hormones by ACE inhibitors, thus reducing blood pressure

Pharmacodynamics/Kinetics

Onset of action: 1 hour

Peak effect: Hypotensive: Oral: ~6 hours

Duration: 24 hours

Absorption: Well absorbed; unaffected by food

Protein binding: 25%

Metabolism: Not metabolized

Bioavailability: Decreased with NYHA Class II-IV heart failure

Half-life elimination: 11-12 hours

Time to peak: ~7 hours

Excretion: Primarily urine (as unchanged drug)

Related Information

- Angiotensin Agents
- Heart Failure (Systolic)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic effects.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause sedation, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, or history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after four years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Anesthesia and Critical Care Concerns/Other ConsiderationsDue to decreases in glomerular filtration (also creatinine clearance) with aging, severe congestive heart failure and renal failure, these patients may experience renal dysfunction with ACE inhibitor administration.

ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. Concomitant NSAID therapy may attenuate blood pressure control. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Eskalith® may be confused with Estratest®

Lithobid® may be confused with Levbid®, Lithostat®

Do not confuse **mEq** (milliequivalent) with **mg** (milligram). **Note:** 8 mEq lithium carbonate equals 300 mg lithium carbonate. Dosage should be written in **mg** (milligrams) to avoid confusion. Check prescriptions for unusually high volumes of the syrup for dosing errors.

Pronunciation(LITH ee um)

U.S. Brand NamesEskalith CR® [DSC]; Eskalith® [DSC]; Lithobid®

Canadian Brand NamesApo-Lithium® Carbonate; Apo-Lithium® Carbonate SR; Carbolith™; Duralith®; Euro-Lithium; Lithane™; PMS-Lithium Carbonate; PMS-Lithium Citrate

Pharmacologic CategoryAntimanic Agent

Use: Labeled IndicationsManagement of bipolar disorders; treatment of mania in individuals with bipolar disorder (maintenance treatment prevents or diminishes intensity of subsequent episodes)

Use: Unlabeled/InvestigationalPotential augmenting agent for antidepressants; aggression, post-traumatic stress disorder, conduct disorder in children

Dosing: Adults

Bipolar disorders: Oral: 900-2400 mg/day in 3-4 divided doses or 900-1800 mg/day in two divided doses of sustained release

Note: Monitor serum concentrations and clinical response (efficacy and toxicity) to determine proper dose

Dosing: ElderlyBipolar disorders: Oral: Initial: 300 mg twice daily; increase weekly in increments of 300 mg/day, monitoring levels; rarely need to go >900-1200 mg/day.

Dosing: Pediatric

Bipolar disorders (unlabeled use): Oral: Children 6-12 years: 15-60 mg/kg/day in 3-4 divided doses; dose not to exceed usual adult dosage. **Note:** Monitor serum concentrations and clinical response (efficacy and toxicity) to determine proper dose.

Conduct disorder (unlabeled use): Oral: Children 6-12 years: 15-30 mg/kg/day in 3-4 divided doses; dose not to exceed usual adult dosage

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 50% to 75% of normal dose.

Cl_{cr} <10 mL/minute: Administer 25% to 50% of normal dose.

Dialyzable (50% to 100%); 4-7 times more efficient than peritoneal dialysis

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister with meals to decrease GI upset. Slow release tablets must be swallowed whole; do not crush or chew.

Dietary ConsiderationsMay be taken with meals to avoid GI upset; have patient drink 2-3 L of water daily.

ContraindicationsHypersensitivity to lithium or any component of the formulation; avoid use in patients with severe cardiovascular or renal disease, or with severe debilitation, dehydration, or sodium depletion; pregnancy

Allergy Considerations

- Lithium Allergy

Warnings/Precautions

Boxed warnings:

- Monitoring: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Renal effects: Chronic therapy results in diminished renal concentrating ability (nephrogenic DI); this is usually reversible when lithium is discontinued. Changes in renal function should be monitored, and re-evaluation of treatment may be necessary. Morphologic changes with glomerular and interstitial fibrosis and nephron atrophy have been reported in patients on chronic lithium therapy; morphologic changes have also been reported in manic-depressive patients never exposed to lithium. The relationship between morphologic changes and renal function, and the association with lithium therapy, have not been established.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with mild-moderate cardiovascular disease.

- Dehydration: Use with caution in patients with significant fluid loss (protracted sweating, diarrhea, or prolonged fever); temporary reduction or cessation of therapy may be warranted.

- Depression/suicidal ideation: Use with caution in patients at risk of suicide (suicidal thoughts or behavior).

- Renal impairment: Use with caution in patients with mild-moderate renal impairment.

- Thyroid disease: Use with caution in patients with thyroid disease.

Concurrent drug therapy issues:

- Medications altering sodium excretion: Use caution in patients receiving medications which alter sodium excretion (eg, diuretics, ACE inhibitors, NSAIDs).

- Neuroleptic medications: Use with caution in patients receiving neuroleptic medications - a syndrome resembling NMS has been associated with concurrent therapy.

- Neuromuscular-blocking agents: Administered neuromuscular-blocking agents with caution; the response may be prolonged.

Special populations:

- Elderly: Use with caution in the elderly; may be extremely sensitive to the effects of lithium, see Dosage and Reference Range.

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Acute manic phase: Higher serum concentrations may be required and tolerated during an acute manic phase; however, the tolerance decreases when symptoms subside.

- Monitoring: **[U.S. Boxed Warning]: Lithium toxicity is closely related to serum concentrations and can occur at therapeutic doses; serum lithium determinations are required to monitor therapy.** Normal fluid and salt intake must be maintained during therapy.

Geriatric ConsiderationsSome elderly patients may be extremely sensitive to the effects of lithium. Initial doses need to be adjusted for renal function in the elderly; thereafter, adjust doses based upon serum concentrations and response.

Pregnancy Risk FactorD

Pregnancy ConsiderationsCardiac malformations in the infant, including Ebstein's anomaly, are associated with use of lithium during the first trimester of pregnancy. Nontoxic effects to the newborn include shallow respiration, hypotonia, lethargy, cyanosis, diabetes insipidus, thyroid depression, and nontoxic goiter when lithium is used near term. Efforts should be made to avoid lithium use during the first trimester; if an alternative therapy is not appropriate, the lowest possible dose of lithium should be used throughout the pregnancy. Fetal echocardiography and ultrasound to screen for anomalies should be conducted between 16-20 weeks of gestation. Lithium levels should be monitored in the mother and may need to be adjusted following delivery.

LactationEnters breast milk/contraindicated

Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiac arrhythmia, hypotension, sinus node dysfunction, flattened or inverted T waves (reversible), edema, bradycardia, syncope

Central nervous system: Dizziness, vertigo, slurred speech, blackout spells, seizure, sedation, restlessness, confusion, psychomotor retardation, stupor, coma, dystonia, fatigue, lethargy, headache, pseudotumor cerebri, slowed intellectual functioning, tics

Dermatologic: Dry or thinning of hair, folliculitis, alopecia, exacerbation of psoriasis, rash

Endocrine & metabolic: Euthyroid goiter and/or hypothyroidism, hyperthyroidism, hyperglycemia, diabetes insipidus

Gastrointestinal: Polydipsia, anorexia, nausea, vomiting, diarrhea, xerostomia, metallic taste, weight gain, salivary gland swelling, excessive salivation

Genitourinary: Incontinence, polyuria, glycosuria, oliguria, albuminuria

Hematologic: Leukocytosis

Neuromuscular & skeletal: Tremor, muscle hyperirritability, ataxia, choreoathetoid movements, hyperactive deep tendon reflexes, myasthenia gravis (rare)

Ocular: Nystagmus, blurred vision, transient scotoma

Miscellaneous: Coldness and painful discoloration of fingers and toes

Drug Interactions

ACE Inhibitors: May increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Amphetamines: Lithium may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: May increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Antipsychotics: Lithium formulations may enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the neurotoxic effect of Lithium. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Lithium. Decreased or unaltered lithium concentrations have also been reported with this combination. *Risk C: Monitor therapy*

CarBAMazepine: May enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Desmopressin: Lithium may diminish the therapeutic effect of Desmopressin. Desmopressin may increase the serum concentration of Lithium. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the adverse/toxic effect of Lithium. **Exceptions:** Moclobemide. *Risk C: Monitor therapy*

Methyldopa: May enhance the adverse/toxic effect of Lithium. This may occur without notable changes in serum lithium concentrations. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Lithium may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May increase the serum concentration of Lithium. **Exceptions:** Sulindac. *Risk D: Consider therapy modification*

Phenytoin: May enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Potassium Iodide: May enhance the adverse/toxic effect of Lithium. Specifically the hypothyroid/goiter-potentiating effects. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sodium Bicarbonate: May increase the excretion of Lithium. *Risk C: Monitor therapy*

Sodium Chloride: May increase the excretion of Lithium. *Risk C: Monitor therapy*

Theophylline Derivatives: May increase the excretion of Lithium. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thiazide Diuretics: May decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Lithium may enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Lithium serum concentrations may be increased if taken with food. Limit caffeine.

Monitoring ParametersSerum lithium every 4-5 days during initial therapy; draw lithium serum concentrations 8-12 hours postdose; renal, thyroid, and cardiovascular function; fluid status; serum electrolytes; CBC with differential, urinalysis; monitor for signs of toxicity; beta-hCG pregnancy test for all females not known to be sterile

Reference RangeLevels should be obtained twice weekly until both patient's clinical status and levels are stable then levels may be obtained every 1-3 months

Timing of serum samples: Draw trough just before next dose (8-12 hours after previous dose)

Therapeutic levels:

Acute mania: 0.6-1.2 mEq/L (SI: 0.6-1.2 mmol/L)

Protection against future episodes in most patients with bipolar disorder: 0.8-1 mEq/L (SI: 0.8-1.0 mmol/L); a higher rate of relapse is described in subjects who are maintained at <0.4 mEq/L (SI: 0.4 mmol/L)

Elderly patients can usually be maintained at lower end of therapeutic range (0.6-0.8 mEq/L)

Toxic concentration: >1.5 mEq/L (SI: >2 mmol/L)

Adverse effect levels:

GI complaints/tremor: 1.5-2 mEq/L

Confusion/somnolence: 2-2.5 mEq/L

Seizures/death: >2.5 mEq/L

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor cardiovascular status; assess for fluid retention. Monitor laboratory results at beginning of therapy, when adjusting dose, and periodically thereafter. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. **Note:** Lithium has a very small window of safety (TI). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and importance of reporting adverse symptoms promptly.

Monitoring: Lab TestsSerum lithium every 4-5 days during initial therapy. Monitor renal and thyroid; serum electrolytes; CBC with differential, urinalysis.

Levels should be obtained twice weekly until both patient's clinical status and levels are stable then levels may be obtained every 1-3 months.

Timing of serum samples: Draw trough just before next dose (8-12 hours after previous dose).

Therapeutic levels:

Acute mania: 0.6-1.2 mEq/L (SI: 0.6-1.2 mmol/L)

Protection against future episodes in most patients with bipolar disorder: 0.8-1 mEq/L (SI: 0.8-1.0 mmol/L); a higher rate of relapse is described in subjects who are maintained at <0.4 mEq/L (SI: 0.4 mmol/L).

Elderly patients can usually be maintained at lower end of therapeutic range (0.6-0.8 mEq/L).

Toxic concentration: >1.5 mEq/L (SI: >2 mmol/L)

Adverse effect levels:

GI complaints/tremor: 1.5-2 mEq/L

Confusion/somnolence: 2-2.5 mEq/L

Seizures/death: >2.5 mEq/L

Patient EducationTake exactly as directed; do not change dosage without consulting prescriber. Do not crush or chew extended or slow release tablets or capsules. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake (especially in summer). Avoid changes in sodium content (eg, low sodium diets); reduction of sodium can increase lithium toxicity. Limit caffeine intake (diuresis can increase lithium toxicity). Frequent blood test and monitoring will be necessary. You may experience decreased appetite or altered taste sensation (small frequent meals may help maintain nutrition); or drowsiness or dizziness, especially during early therapy (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Immediately report unresolved diarrhea, abrupt changes in weight, muscular tremors or lack of coordination, fever, or changes in urinary volume. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, as carbonate: 150 mg, 300 mg, 600 mg

Eskalith®: 300 mg [contains benzyl alcohol] [DSC]

Solution, as citrate: 300 mg/5 mL (5 mL, 500 mL) [equivalent to amount of lithium in lithium carbonate]

Syrup, as citrate: 300 mg/5 mL (480 mL) [equivalent to amount of lithium in lithium carbonate]

Tablet, as carbonate: 300 mg

Tablet, controlled release, as carbonate: 450 mg

Eskalith CR®: 450 mg [DSC]

Tablet, slow release, as carbonate: 300 mg

Lithobid®: 300 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Lithium Carbonate)

150 mg (90): $18.99

300 mg (90): $17.99

600 mg (90): $39.99

Syrup (Lithium Citrate)

8 mEq/5 mL (500): $60.00

Tablet, controlled release (Lithium Carbonate)

300 mg (30): $14.99

450 mg (60): $28.99

Tablet, controlled release (Lithobid)

300 mg (90): $180.05

Tablets (Lithium Carbonate)

300 mg (90): $24.99

Mechanism of ActionAlters cation transport across cell membrane in nerve and muscle cells and influences reuptake of serotonin and/or norepinephrine; second messenger systems involving the phosphatidylinositol cycle are inhibited; postsynaptic D2 receptor supersensitivity is inhibited

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Distribution: V_d: Initial: 0.3-0.4 L/kg; V_{dss}: 0.7-1 L/kg; crosses placenta; enters breast milk at 35% to 50% the concentrations in serum; distribution is complete in 6-10 hours

CSF, liver concentrations: $^1/_3$ to $^1/_2$ of serum concentration

Erythrocyte concentration: ~$^1/_2$ of serum concentration

Heart, lung, kidney, muscle concentrations: Equivalent to serum concentration

Saliva concentration: 2-3 times serum concentration

Thyroid, bone, brain tissue concentrations: Increase 50% over serum concentrations

Protein binding: Not protein bound

Metabolism: Not metabolized

Bioavailability: Not affected by food; Capsule, immediate release tablet: 95% to 100%; Extended release tablet: 60% to 90%; Syrup: 100%

Half-life elimination: 18-24 hours; can increase to more than 36 hours in elderly or with renal impairment

Time to peak, serum: Nonsustained release: ~0.5-2 hours; slow release: 4-12 hours; syrup: 15-60 minutes

Excretion: Urine (90% to 98% as unchanged drug); sweat (4% to 5%); feces (1%)

Clearance: 80% of filtered lithium is reabsorbed in the proximal convoluted tubules; therefore, clearance approximates 20% of GFR or 20-40 mL/minute

- Liquid Compatibility
- Teratogenic Risks of Psychotropic Medications

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), salivary gland swelling, and metallic taste. Avoid NSAIDs if analgesics are required since lithium toxicity has been reported with concomitant administration; acetaminophen products (ie, singly or with narcotics) are recommended.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Child/Adolescent ConsiderationsInformation regarding the safety and effectiveness of lithium carbonate in children <12 years of age is not available; its use in this population group is not recommended.

Mental Health CommentLithium remains the gold standard for bipolar disorder. It is most useful for the management of euphoric mania and least effective for the mixed and rapid-cycling types of bipolar disorder. Among patients treated for bipolar disorder, risk of suicide attempt and suicide death is lower during treatment with lithium than during treatment with divalproex (Goodwin, 2003). Fine hand tremor associated with lithium therapy may be treated with propranolol. Incidence of hypothyroidism secondary to lithium therapy is 7% to 8% with a 9:1 female to male ratio. Diabetes insipidus may be treated with a thiazide diuretic (hydrochlorothiazide 25-50 mg/day) or amiloride (5-10 mg twice daily). The thiazide diuretics are thought to work by decreasing intracellular volume via sodium depletion, thereby enhancing reabsorption of sodium and water proximally leading to a decrease in fluid volume to the distal convoluted tubule and collecting duct which increases sodium reabsorption and decreases water excretion. Leukocytosis (without a left shift) begins in the first week of lithium therapy, peaks at 2 weeks.

Jump To Field (Select Field Name)

Medication Safety Issues

International issues:

Thilomide® [Turkey] may be confused with Thalomid® which is a brand name for thalidomide in the U.S.

Pronunciation(loe DOKS a mide)
U.S. Brand NamesAlomide®
Canadian Brand NamesAlomide®
Pharmacologic CategoryMast Cell Stabilizer
Use: Labeled IndicationsTreatment of vernal keratoconjunctivitis, vernal conjunctivitis, and vernal keratitis
Dosing: AdultsVernal conjunctivitis, keratitis: Ophthalmic: Children ≥2 years and Adults: Instill 1-2 drops in eye(s) 4 times/day for up to 3 months
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥2 years: Refer to adult dosing.
ContraindicationsHypersensitivity to lodoxamide tromethamine or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Irritation: May cause transient burning or stinging.

Special populations:

- Contact lens wearers: Contains benzalkonium chloride which may be adsorbed by contact lenses; remove contacts prior to administration and wait 15 minutes before reinserting.

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only; not for injection.

Geriatric ConsiderationsAssure the patient or caregiver can adequately administer ophthalmic medication.
Pregnancy Risk FactorB
Adverse Reactions

>10%: Local: Transient burning, stinging, discomfort

1% to 10%:

Central nervous system: Headache

Ocular: Blurred vision, corneal erosion/ulcer, eye pain, corneal abrasion, blepharitis

<1%: Dizziness, somnolence, rash, nausea, stomach discomfort, sneezing, dry nose

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess patient response. Teach patient proper use, side effects/appropriate interventions, and symptoms to report.
Patient EducationFor use in eyes only. Avoid wearing soft contact lenses while using this medication. Wash hands before using. Lie down or tilt your head back and look upward. Hold dropper tip as near as possible to your eyelid without touching it. Pull the lower lid of eye down to form a pocket. Drop the prescribed number of drops into the pocket made by the lower lid and the eye. (Placing drops on the surface of the eyeball can cause stinging.) Do not blink or rub eye. Close your eye and press lightly against the inside corner of your eye for about 1 minute. Repeat in other eye if directed by prescriber. Replace and tighten cap right away, do not allow tip of dropper to become contaminated. Wipe off any excess liquid from cheek. Wash your hands again. Do not use any other eye medication without consulting prescriber. Do not share mediation with anyone else. You may experience temporary stinging or burning in the eyes, headache, increased eye tearing or dry eye, sneezing, or blurred vision. Inform prescriber if you experience eye pain, disturbance of vision; skin rash; swelling in or around the eyes; any other adverse response; or if condition worsens or fails to improve. Store medication at room temperature, away from excess heat and moisture. Do not use if solution has changed color, is cloudy, or contains particles.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic: 0.1% (10 mL) [contains benzalkonium chloride]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Solution (Alomide)

0.1% (10): $97.78

Mechanism of ActionMast cell stabilizer that inhibits the *in vivo* type I immediate hypersensitivity reaction to increase cutaneous vascular permeability associated with IgE and antigen-mediated reactions

Pharmacodynamics/KineticsAbsorption: Topical: Negligible

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsLodoxamide Tromethamine

International Brand NamesAlconmide (PH); Almide (FR); Alomide (AR, AT, BE, BF, BG, BJ, BR, CH, CI, CL, CN, CO, CZ, DE, DK, ES, ET, FI, GB, GH, GM, GN, GR, HK, HN, HU, ID, IE, IL, IT, KE, LR, LU, MA, ML, MR, MU, MW, MX, MY, NE, NG, NO, PE, PK, PL, PT, PY, SC, SD, SG, SL, SN, TH, TN, TW, TZ, UG, UY, VE, ZA, ZM, ZW); Lomide (AU)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lomustine may be confused with carmustine

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Lomustine should only be administered as a single dose once every 6 weeks; serious errors have occurred when lomustine was inadvertently administered daily.

Pronunciation(loe MUS teen)

U.S. Brand NamesCeeNU®

Canadian Brand NamesCeeNU®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent

Use: Labeled IndicationsTreatment of brain tumors and Hodgkin's disease

Use: Unlabeled/InvestigationalNon-Hodgkin's lymphoma, melanoma, renal carcinoma, lung cancer, colon cancer

Dosing: AdultsRefer to individual protocols.

Chemotherapy: Oral: 100-130 mg/m^2 as a single dose once every 6 weeks; readjust after initial treatment according to platelet and leukocyte counts

With compromised marrow function: Initial dose: 100 mg/m^2 as a single dose once every 6 weeks

Note: Repeat courses should only be administered after adequate recovery: Leukocytes >4000/mm^3 and platelet counts >100,000/mm^3

Subsequent dosing adjustment based on nadir:

Leukocytes 2000-2999/mm^3, platelets 25,000-74,999/mm^3: Administer 70% of prior dose

Leukocytes <2000/mm^3, platelets <25,000/mm^3: Administer 50% of prior dose

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChemotherapy: Oral (refer to individual protocols): Children: 75-150 mg/m^2 as a single dose once every 6 weeks; subsequent doses are readjusted after initial treatment according to platelet and leukocyte counts.

Dosing: Renal Impairment

The FDA-approved labeling does not contain renal dosing adjustment guidelines. The following guidelines have been used by some clinicians:

Aronoff, 2007: Adults:

Cl_{cr} 10-50 mL/minute: Administer 75% of dose

Cl_{cr} <10 mL/minute: Administer 25% to 50% of dose

Hemodialysis: Supplemental dose is not necessary

Continuous ambulatory peritoneal dialysis (CAPD): Administer 25% to 50% of dose

Kintzel, 1995:

Cl_{cr} 46-60 mL/minute: Administer 75% of normal dose

Cl_{cr} 31-45 mL/minute: Administer 70% of normal dose

Cl_{cr} ≤30 mL/minute: Avoid use

Dosing: Hepatic ImpairmentThe FDA-approved labeling does not contain hepatic adjustment guidelines; lomustine is hepatically metabolized and caution should be used in patients with hepatic dysfunction.

Dosing: Combination Regimens

Brain tumors:

8 in 1 (Brain Tumors)

PCV

POC

Gastric cancer: FAMe

Lymphoma, Hodgkin's disease: CAD/MOPP/ABV

Melanoma:

BOLD

BOLD + Interferon

BOLD (Melanoma)

Retinoblastoma: 8 in 1 (Retinoblastoma)

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralTake with fluids on an empty stomach; no food or drink for 2 hours after administration.

Dietary ConsiderationsShould be taken with fluids on an empty stomach; no food or drink for 2 hours after administration to decrease nausea.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to lomustine, any component of the formulation, or other nitrosoureas; pregnancy

Allergy Considerations

- Nitrosourea Allergy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warnings]: Bone marrow suppression, notably thrombocytopenia and leukopenia, may lead to bleeding and overwhelming infections in an already compromised patient;** will last for at least 6 weeks after a dose. Do not administer courses more frequently than every 6 weeks because the toxicity is delayed. Use with caution in patients with depressed platelet, leukocyte or erythrocyte counts. Bone marrow toxicity is cumulative; dose adjustments should be based on nadir counts from prior dose.
- Pulmonary toxicity: May cause delayed pulmonary toxicity (infiltrates and/or fibrosis); usually related to cumulative doses >1100 mg/m^2.
- Secondary malignancies: Long-term use may be associated with the development of secondary malignancies.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; may require dosage adjustment.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects and embryotoxicity have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women. May cause fetal harm when administered to a pregnant woman. Women of childbearing potential should be advised to avoid pregnancy and should be advised of the potential harm to the fetus.

LactationEnters breast milk/contraindicated

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is contraindicated

Adverse Reactions

>10%:

Gastrointestinal: Nausea and vomiting, usually within 3-6 hours after oral administration. Administration of the dose at bedtime, with an antiemetic, significantly reduces both the incidence and severity of nausea.

Hematologic: Myelosuppression, common, dose-limiting, may be cumulative and irreversible; leukopenia (65%; nadir: 5-6 weeks; recovery 6-8 weeks); thrombocytopenia (nadir: 4 weeks; recovery 5-6 weeks)

Frequency not defined: Acute leukemia, alkaline phosphatase increased, alopecia, anemia, ataxia, azotemia (progressive), bilirubin increased, blindness, bone marrow dysplasia, disorientation, dysarthria, kidney size decreased, lethargy, optic atrophy, pulmonary fibrosis, pulmonary infiltrates, renal failure, stomatitis, transaminases increased, visual disturbances

Oncology: Emetic PotentialHigh (60% to 90%)
Metabolism/Transport Effects**Substrate** of CYP2D6 (major); **Inhibits** CYP2D6 (weak), 3A4 (weak)
Drug Interactions

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).
Test InteractionsLiver function tests
Monitoring ParametersCBC with differential and platelet count (for at least 6 weeks after dose), hepatic and renal function tests (periodic), pulmonary function tests (baseline and periodic)
Nursing: Physical Assessment/MonitoringAssess patient's hematology and liver stature prior to beginning therapy; bone marrow depression may lead to bleeding and overwhelming infections in an already compromised patient. Assess potential for interactions with other pharmacological agents patient may be taking (eg, decreased levels/effects of lomustine, increased toxicity). Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions prior to each treatment and on a regular basis throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential and platelet count (for at least 6 weeks after dose), hepatic and renal function tests (periodic), pulmonary function tests (baseline and periodic)
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take with fluids on an empty stomach; do not eat or drink for 2 hours prior to or following administration to reduce nausea and vomiting. Your prescriber may recommend that you take your medication at bedtime with a prescribed antiemetic to reduce the severity of nausea. During therapy, do not use excessive alcohol. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). You may experience hair loss (reversible); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help or consult prescriber for approved antiemetic); mouth sores (frequent mouth care and use of a soft toothbrush or cotton swabs may help); or diarrhea (buttermilk, boiled milk, or yogurt may help reduce diarrhea - consult prescriber for approved medication). Report persistent nausea, vomiting, or diarrhea; bleeding or bruising; fever, chills, sore throat; vaginal discharge; rash; blood in urine, stool, or vomitus; delayed healing of any wounds; yellowing of skin or eyes; or changes in color of urine of stool.
Pregnancy/breast-feeding precautions: Do not get pregnant while taking this medication and for 1 month following therapy. Consult prescriber for appropriate contraceptives measures. This drug may cause severe fetal birth defects. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

CeeNU®: 10 mg, 40 mg, 100 mg

Capsule [dose pack]:

CeeNU®: 10 mg (2s); 40 mg (2s); 100 mg (2s) [DSC]

Generic AvailableNo
ManufacturerBristol-Myers Squibb Company (Pharmaceutical Division)
Pricing: U.S. (www.drugstore.com)

Capsules (CeeNU)

10 mg (30): $328.46

300 mg (1): $25.99

Mechanism of ActionInhibits DNA and RNA synthesis via carbamylation of DNA polymerase, alkylation of DNA, and alteration of RNA, proteins, and enzymes
Pharmacodynamics/Kinetics

Duration: Marrow recovery: ~5-8 weeks

Absorption: Complete

Distribution: Crosses blood-brain barrier to a greater degree than BCNU; CNS concentrations are ≥50% of plasma concentrations

Metabolism: Rapidly hepatic via hydroxylation producing at least two active metabolites; enterohepatically recycled

Half-life elimination: Parent drug: 16-72 hours; Active metabolite: 16-48 hours

Time to peak, serum: Active metabolite: ~3 hours

Excretion: Urine (~50%); feces (<5%); expired air (<10%)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause sedation or disorientation

Mental Health: Effects on Psychiatric TreatmentMyelosuppression is common; avoid usage with clozapine and carbamazepine; concurrent use with phenobarbital may result in diminished efficacy of both drugs

Index TermsCCNU; NSC-79037

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(loe PER a mide & sye METH i kone)

U.S. Brand NamesImodium® Advanced

Pharmacologic CategoryAntidiarrheal; Antiflatulent

Use: Labeled IndicationsControl of symptoms of diarrhea and gas (bloating, pressure, and cramps)

Dosing: Adults**Acute diarrhea:** Oral: 1 caplet or tablet after first loose stool, followed by 1 caplet or tablet with each subsequent loose stool (maximum: 4 caplets or tablets/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Acute diarrhea** (weight-based dosing is preferred):

Children 6-8 years (48-59 lbs): 1 caplet or tablet after first loose stool, followed by $^1/_2$ caplet/tablet with each subsequent loose stool (maximum: 2 caplets or tablets/24 hours)

Children 9-11 years (60-95 lbs): 1 caplet or tablet after first loose stool, followed by $^1/_2$ caplet or tablet with each subsequent loose stool (maximum: 3 caplets or tablets/24 hours)

Children >12 years: Refer to adult dosing.

Administration: OralAdminister each dose with 4–8 ounces of water.

StorageStore between 20°C and 25°C (68°F and 77°F). Protect from light.

ContraindicationsHypersensitivity to loperamide, simethicone, or any component of the formulation; bloody or black stool

Warnings/Precautions

Other warnings/precautions:

- OTC labeling: Consult healthcare provider prior to using, if taking antibiotics, if pregnant, or in the presence of fever, mucus in stool, or a history of liver disease. Do not take if diarrhea is bloody or black. Use should be stopped and healthcare provider consulted if symptoms get worse, diarrhea persists for >2 days, or abdominal swelling or bulging occurs. Tiredness, drowsiness, or dizziness may occur; use caution if performing tasks which require mental alertness (eg, operating machinery or driving).

Geriatric Considerations

Elderly are particularly sensitive to fluid and electrolyte loss. This generally results in lethargy, weakness, and confusion. Repletion and maintenance of electrolytes and water are essential in the treatment of diarrhea. Drug therapy must be limited in order to avoid toxicity with this agent. Before treating excess gas or pain due to gas accumulation, a thorough evaluation must be made to determine cause since many bowel diseases may present with flatulence and bloating.

Pregnancy ConsiderationsSee individual agents.

Breast-Feeding ConsiderationsSee individual agents.

Adverse ReactionsSee individual agents.

Drug Interactions

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAttempt to identify for cause of diarrhea before administering. Use caution in presence of fever, mucus in stool, or history of liver disease; avoid use if stool is bloody or black. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication is for relief of symptoms of diarrhea and relief from bloating, pressure, and cramps. Do not use if you have bloody or black stool. Consult health care professional before taking this medication if you have fever, mucus in stool, a history of liver disease, taking antibiotics, or are pregnant. Use exactly as directed; do not take more than recommended. Maintain adequate fluid intake to prevent dehydration caused by diarrhea. You may experience unusual tiredness, drowsiness, or dizziness (use caution when driving or engaging is potentially hazardous tasks until response to medication is known). Stop taking and consult healthcare professional if symptoms get worse, diarrhea persists for > 2 days, or abdominal pain occurs.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet: Loperamide hydrochloride 2 mg and simethicone 125 mg

Tablet, chewable: Loperamide hydrochloride 2 mg and simethicone 125 mg [mint flavor]

Generic AvailableNo

Manufacturer

McNeil Consumer

Mechanism of Action

Loperamide acts by slowing intestinal motility and by affecting water and electrolyte movement through the bowel.

Simethicone acts in the stomach and intestines by altering the surface tension of gas bubbles enabling them to coalesce thereby freeing and eliminating the gas more easily by belching or passing flatus.

Pharmacodynamics/KineticsSee individual agents.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness
Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation and dry mouth
Index TermsSimethicone and Loperamide Hydrochloride

Loperamide

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Imodium® A-D may be confused with Indocin®, Ionamin®

Pronunciation(loe PER a mide)

U.S. Brand NamesDiamode [OTC]; Imodium® A-D [OTC]; K-Pek II [OTC]; Kao-Paverin® [OTC]

Canadian Brand NamesApo-Loperamide®; Diarr-Eze; Dom-Loperamide; Imodium®; Loperacap; Novo-Loperamide; PMS-Loperamine; Rhoxal-Loperamide; Rho®-Loperamine; Riva-Loperamide; Sandoz-Loperamide

Pharmacologic CategoryAntidiarrheal

Use: Labeled IndicationsTreatment of chronic diarrhea associated with inflammatory bowel disease; acute nonspecific diarrhea; increased volume of ileostomy discharge

OTC labeling: Control of symptoms of diarrhea, including Traveler’s diarrhea

Use: Unlabeled/InvestigationalCancer treatment-induced diarrhea (eg, irinotecan induced); chronic diarrhea caused by bowel resection

Dosing: Adults

Acute diarrhea: Oral: Initial: 4 mg, followed by 2 mg after each loose stool, up to 16 mg/day

Chronic diarrhea: Oral: Initial: Follow acute diarrhea; maintenance dose should be slowly titrated downward to minimum required to control symptoms (typically, 4-8 mg/day in divided doses)

Traveler's diarrhea: Oral: Initial: 4 mg after first loose stool, followed by 2 mg after each subsequent stool (maximum dose: 8 mg/day)

Irinotecan-induced diarrhea (unlabeled use): Oral: 4 mg after first loose or frequent bowel movement, then 2 mg every 2 hours until 12 hours have passed without a bowel movement. If diarrhea recurs, then repeat administration

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Acute diarrhea: Initial doses (in first 24 hours):

2-5 years (13-20 kg): 1 mg 3 times/day

6-8 years (20-30 kg): 2 mg twice daily

8-12 years (>30 kg): 2 mg 3 times/day

Maintenance: After initial dosing, 0.1 mg/kg doses after each loose stool, but not exceeding initial dosage

Traveler's diarrhea:

6-8 years: 2 mg after first loose stool, followed by 1 mg after each subsequent stool (maximum dose: 4 mg/day)

9-11 years: 2 mg after first loose stool, followed by 1 mg after each subsequent stool (maximum dose: 6 mg/day)

≥12 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentNo specific guidelines available.

Dietary Considerations

Imodium® A-D [new formulation] contains sodium 10 mg/30 mL.

StorageStore at 15°C to 25°C (59°F to 77°F).

ContraindicationsHypersensitivity to loperamide or any component of the formulation; abdominal pain without diarrhea; children <2 years

Avoid use as primary therapy in acute dysentery, acute ulcerative colitis, bacterial enterocolitis, pseudomembranous colitis

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: Rare cases of anaphylaxis and anaphylactic shock have been reported.
- GI effects: Discontinue if constipation, abdominal pain, or ileus develop.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment because of reduced first-pass metabolism; monitor for signs of CNS toxicity.

Special populations:

- AIDS patients: Use with caution in treatment of AIDS patients; stop therapy at the sign of abdominal distention. Cases of toxic megacolon have occurred in AIDS patients with infectious colitis.

- Pediatrics: Use with caution in young children as response may be variable because of dehydration.

Other warnings/precautions:

- Appropriate use: Loperamide is a symptom-directed treatment; if an underlying diagnosis is made, other disease-specific treatment may be indicated. Should not be used if diarrhea is accompanied by high fever or blood in stool. Should not be used when inhibition of peristalsis is undesirable or dangerous. Concurrent fluid and electrolyte replacement is often necessary in all age groups depending upon severity of diarrhea.

- OTC labeling: If diarrhea lasts longer than 2 days, patient should stop taking loperamide and consult healthcare provider.

Geriatric ConsiderationsElderly are particularly sensitive to fluid and electrolyte loss. This generally results in lethargy, weakness, and confusion. Repletion and maintenance of electrolytes and water are essential in the treatment of diarrhea. Drug therapy must be limited in order to avoid toxicity with this agent.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies.

LactationEnters breast milk/not recommended.

Adverse Reactions1% to 10%:

Central nervous system: Dizziness (1%)

Gastrointestinal: Constipation (2% to 5%), abdominal cramping (<1% to 3%), nausea (<1% to 3%)

Postmarketing and/or case reports: Abdominal distention, abdominal pain, allergic reactions, anaphylactic shock, anaphylactoid reactions, angioedema, bullous eruption (rare), drowsiness, dry mouth, dyspepsia, erythema multiforme (rare), fatigue, flatulence, paralytic ileus, megacolon, pruritus, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, toxic megacolon, urinary retention, urticaria, vomiting

Metabolism/Transport Effects**Substrate** (minor) of CYP2B6

Drug Interactions

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess for cause of diarrhea before administering first dose. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationAdults should not take more than 8 capsules or 80 mL in 24 hours. May cause drowsiness; use caution. Increased exercise, identifying and avoiding foods that cause diarrhea, safe food preparation and storage, use of buttermilk, yogurt, or boiled milk may help reduce diarrhea. If acute diarrhea lasts longer than 48 hours, consult prescriber. Do not take if diarrhea is bloody. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to be pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet, as hydrochloride: 2 mg

Diamode, Imodium® A-D, Kao-Paverin®: 2 mg

Capsule, as hydrochloride: 2 mg

Liquid, oral, as hydrochloride: 1 mg/5 mL (5 mL, 10 mL, 120 mL)

Imodium® A-D: 1 mg/5 mL (60 mL, 120 mL) [contains alcohol, sodium benzoate, benzoic acid; cherry mint flavor]

Imodium® A-D [new formulation]: 1 mg/7.5 mL (60 mL, 120 mL, 360 mL) [contains sodium 10 mg/30 mL, sodium benzoate; creamy mint flavor]

Tablet, as hydrochloride: 2 mg

K-Pek II: 2 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Loperamide HCl)

2 mg (30): $11.99

Mechanism of ActionActs directly on circular and longitudinal intestinal muscles, through the opioid receptor, to inhibit peristalsis and prolong transit time; reduces fecal volume, increases viscosity, and diminishes fluid and electrolyte loss; demonstrates antisecretory activity.

Loperamide increases tone on the anal sphincter

Pharmacodynamics/Kinetics

Absorption: Poor

Distribution: Poor penetration into brain; low amounts enter breast milk

Metabolism: Hepatic via oxidative N-demethylation

Half-life elimination: 7-14 hours

Time to peak, plasma: Liquid: 2.5 hours; Capsule: 5 hours

Excretion: Urine and feces (1% as metabolites, 30% to 40% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation and dry mouth

Index TermsLoperamide Hydrochloride

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Potential for dispensing errors between Kaletra™ and Keppra® (levetiracetam)

Administration issues:

Children's doses are based on weight and calculated by milligrams of lopinavir. Care should be taken to accurately calculate the dose. The oral solution contains lopinavir 80 mg and ritonavir 20 mg per one mL. Children <12 years of age (and ≤40 kg) who are not taking certain concomitant antiretroviral medications will receive <5 mL of solution per dose.

Pronunciation(loe PIN a veer & rit ON uh veer)

U.S. Brand NamesKaletra®

Canadian Brand NamesKaletra®

Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor

Use: Labeled IndicationsTreatment of HIV infection in combination with other antiretroviral agents

Dosing: Adults

HIV infection (as a component of combination therapy): Oral:

Therapy-naive: Lopinavir 800 mg/ritonavir 200 mg once daily **or** lopinavir 400 mg/ritonavir 100 mg twice daily. **Note:** Once-daily dosing regimen should not be used with concurrent indinavir, maraviroc, saquinavir, phenytoin, carbamazepine, or phenobarbital therapy.

Therapy-experienced: Lopinavir 400 mg/ritonavir 100 mg twice daily. **Note:** For therapy-experienced patients receiving efavirenz or nevirapine, clinicians may use lopinavir 600 mg/ritonavir 150 mg twice daily **or** lopinavir 533 mg/ritonavir 133 mg solution twice daily (AIDS info guidelines)

Dosage adjustment for combination therapy: Oral:

*When taken with amprenavir, efavirenz, fosamprenavir, nelfinavir, or nevirapine:***Note:** Once-daily dosing regimen should not be used.

Therapy-naive and therapy-experienced patients:

Solution: Lopinavir 533 mg/ritonavir 133 mg (6.5 mL) twice daily

Tablet: Lopinavir 500 mg/ritonavir 125 mg twice daily

When taken with maraviroc (Selzentry™): Lopinavir 400 mg/ritonavir 100 mg twice daily

When taken with saquinavir (Invirase®): Lopinavir 400 mg/ritonavir 100 mg twice daily

Dosing: ElderlyInitial studies did not include enough elderly patients to determine effects based on age. Use with caution due to possible decreased hepatic, renal, and cardiac function.

Dosing: Pediatric

HIV infection (component of combination therapy): Oral: Dosage based on weight or body surface area (BSA), **presented based on lopinavir component** (maximum dose: Lopinavir 400 mg/ritonavir 100 mg).

14 days to 6 months: 16 mg/kg or 300 mg/m^2 twice daily

6 months to 18 years: **Note:** FDA-approved dose is approximately equivalent to lopinavir 230 mg/m^2 per dose.

<15 kg: 12 mg/kg twice daily

15-40 kg: 10 mg/kg twice daily

>40 kg: Lopinavir 400 mg/ritonavir 100 mg twice daily

Note: For therapy-experienced patients with suspected reduced susceptibility to lopinavir, refer to adult dosing.

Children >12 years: Therapy-naive: Lopinavir 400 mg/ritonavir 100 mg twice daily. (AIDS Info guidelines). **Note:** For therapy-experienced patients with suspected reduced susceptibility to lopinavir, refer to adult dosing.

Dosage adjustment for combination therapy: Oral:

When taken with amprenavir, efavirenz, fosamprenavir, nelfinavir, or nevirapine: **Note:** Once-daily dosing regimen should not be used.

Children 14 days to 6 months: Combination therapy with these agents is not recommended due to lack of data.

Children 6 months to 18 years: Solution or tablet (**based on mg of lopinavir component**): FDA-approved dose is approximately equivalent to lopinavir 300 mg/m^2 per dose:

<15 kg: 13 mg/kg twice daily (**Note:** Tablets are not recommended)

15-45 kg: 11 mg/kg twice daily

>45 kg: Refer to adult dosing.

When taken with maraviroc (Selzentry™): Lopinavir 400 mg/ritonavir 100 mg twice daily

When taken with saquinavir (Invirase®): Lopinavir 400 mg/ritonavir 100 mg twice daily

Dosing: Renal Impairment Has not been studied in patients with renal impairment; however, a decrease in clearance is not expected.

Dosing: Hepatic Impairment Lopinavir AUC may be increased ~30% in patients with mild-to-moderate hepatic impairment. No data available in patients with severe impairment.

Administration: Oral Once-daily dosing is not recommended in therapy-experienced patients, those receiving efavirenz, nevirapine, nelfinavir, amprenavir, or fosamprenavir, or in children <18 years of age.

Solution: Administer with food; if using didanosine, take didanosine 1 hour before or 2 hours after lopinavir/ritonavir. Administer using calibrated dosing syringe.

Tablet: May be taken with or without food. Swallow whole, do not break, crush, or chew. May be taken with didanosine when taken without food. Tablets are not recommended in patients <15 kg.

Dietary Considerations Solution should be taken with food. Tablet may be taken with or without food

Storage

Oral solution: Store at 2°C to 8°C (36°F to 46°F). Avoid exposure to excessive heat. If stored at room temperature (25°C or 77°F), use within 2 months.

Tablet: Store at USP controlled room temperature of 20°C to 25°C (68°F to 77°F). Exposure to high humidity outside of the original container for >2 weeks is not recommended.

Contraindications Hypersensitivity (eg, Stevens-Johnson syndrome, erythema multiforme) to lopinavir, ritonavir, or any component of the formulation; coadministration with medications highly dependent upon CYP3A4 for clearance for which increased levels are associated with serious and/or life-threatening events; coadministration with strong CYP3A4 inducers, including cisapride, ergot alkaloids (eg, dihydroergotamine, ergonovine, ergotamine, methylergonovine), lovastatin, midazolam (oral), pimozide, rifampin, simvastatin, St John's wort, triazolam

Allergy Considerations

- Ritonavir Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Increased cholesterol: Increases in total cholesterol and triglycerides have been reported; screening should be done prior to therapy and periodically throughout treatment.

Disease-related concerns:

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.
- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.
- Hepatic impairment: May cause hepatitis and/or exacerbate pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C, cirrhosis, or unspecified hepatic impairment.
- Pancreatitis: Use with caution in patients with increased triglycerides; pancreatitis has been observed. Patients with history of pancreatitis may be at increased risk. Monitor serum lipase and amylase.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); contraindicated with certain CYP3A4 substrates and inducers (see Contraindications); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established for children <14 days of age.

Dosage form specific issues:

- Oral solution: The oral solution is highly concentrated and contains large amounts of alcohol. Healthcare providers should pay special attention to accurate calculation, measurement, and administration of dose. Overdose in a child may lead to lethal alcohol toxicity.

Other warnings/precautions:

- Appropriate use: Once-daily dosing is not recommended in therapy-experienced patients, those receiving efavirenz, nevirapine, nelfinavir, amprenavir, or fosamprenavir, or in children <18 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events were not seen in animal studies, except at doses which were also maternally toxic. Safety and pharmacokinetic studies of the tablet in pregnant women are not completed. Preliminary information suggests increased dosage may be needed during pregnancy, although specific recommendations with the tablet formulation are not yet available. Once-daily dosing is not recommended during pregnancy. Lopinavir/ritonavir crosses the placenta, however, teratogenic effects have not been observed in humans. The Perinatal HIV Guidelines Working Group considers this a recommended combination for use during pregnancy. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsData presented for short- and long-term combination antiretroviral therapy in both protease inhibitor experienced and naïve patients.

>10%:

Dermatologic: Rash (children 12%; adults up to 5%)

Endocrine & metabolic: Hypercholesterolemia (3% to 39%), triglycerides increased (4% to 36%)

Gastrointestinal: Diarrhea (5% to 28%), abnormal taste/taste perversion (children 22%; adults <2%), vomiting (children 21%; adults 2% to 6%), nausea (5% to 16%), abdominal pain (2% to 11%)

Hepatic: GGT increased (10% to 29%), ALT increased (grade 3/4: 3% to 11%)

2% to 10%:

Cardiovascular: Hypertension (up to 2%), vein distension (up to 3%)

Central nervous system: Headache (2% to 6%), insomnia (up to 3%), chills (up to 2%), depression (up to 2%), fever (2%)

Endocrine & metabolic: Amenorrhea (up to 5%), hyperglycemia (1% to 5%), hyperuricemia (up to 5%), sodium decreased or increased (3% children), hypogonadism (males: up to 2%), inorganic phosphorus decreased (1% to 2%), libido decreased (up to 2%)

Gastrointestinal: Amylase increased (3% to 8%), dyspepsia (up to 6%), flatulence (1% to 4%), weight loss (up to 3%), dysphagia (up to 2%), anorexia (up to 2%)

Hematologic: Platelets decreased (grade 3/4: 4% children), neutropenia (grade 3/4: 1% to 5%)

Hepatic: AST increased (grade 3/4: 2% to 10%), bilirubin increased (1%, children 3%)

Neuromuscular & skeletal: Weakness (up to 9%), myalgia (up to 2%), paresthesia (up to 2%)

Respiratory: Bronchitis (up to 2%)

<2%:

Cardiovascular: Atrial fibrillation, cerebral infarction, chest pain, deep vein thrombosis, edema, facial edema, MI, palpitation, peripheral edema, postural hypotension, vasculitis

Central nervous system: Abnormal dreams, abnormal thinking, agitation, amnesia, anxiety, apathy, ataxia, confusion, dizziness, emotional lability, encephalopathy, extrapyramidal symptoms, facial paralysis, malaise, migraine, nervousness, neuropathy, peripheral neuritis, seizure, somnolence, vertigo

Dermatologic: Acne, alopecia, benign neoplasm, dry skin, eczema, exfoliative dermatitis, furunculosis, maculopapular rash, nail disorder, pruritus, seborrhea, skin discoloration, skin ulcer, striae

Endocrine & metabolic: Breast enlargement, Cushing's syndrome, diabetes mellitus, glucose intolerance, gynecomastia, hypothyroidism, lactic acidosis

Gastrointestinal: Appetite increased, constipation, dehydration, enteritis, enterocolitis, eructation, esophagitis, fecal incontinence, gastritis, gastroenteritis, gastrointestinal disorder, hemorrhagic colitis, mouth ulceration, pancreatitis, periodontitis, sialadenitis, stomatitis, ulcerative stomatitis, weight gain, xerostomia

Genitourinary: Abnormal ejaculation, impotence

Hematologic: Anemia, leukopenia, lymphadenopathy

Hepatic: Cholangitis, cholecystitis, fatty deposits, hepatic dysfunction, hepatitis, hepatomegaly, jaundice, liver tenderness

Local: Thrombophlebitis

Neuromuscular & skeletal: Arthralgia, arthrosis, back pain, dyskinesia, hypertonia, joint disorder, myasthenia, paresthesia, tremor

Ocular: Abnormal vision, eye disorder

Otic: Otitis media, tinnitus

Renal: Kidney calculus, nephritis, urine abnormality

Respiratory: Asthma, cough, dyspnea, lung edema, pharyngitis, rhinitis, sinusitis

Miscellaneous: Allergic reaction, avitaminosis, bacterial infection, bone necrosis, cyst, diaphoresis, flu-like syndrome, hypertrophy, obesity, viral infection

Postmarketing and/or case reports: Body fat redistribution, bradyarrhythmia, erythema multiforme, immune reconstitution syndrome, neoplasm, Stevens-Johnson syndrome

Metabolism/Transport Effects

Lopinavir: **Substrate** of CYP3A4 (major); **Inhibits** P-glycoprotein

Ritonavir: **Substrate** of CYP1A2 (minor), 2B6 (minor), 2D6 (major), 3A4 (major); **Inhibits** CYP2C8 (strong), 2C9 (weak), 2C19 (weak), 2D6 (strong), 2E1 (weak), 3A4 (strong); **Induces** CYP1A2 (weak), 2C8 (weak), 2C9 (weak), 3A4 (weak)

Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Protease Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Atovaquone: Ritonavir may decrease the serum concentration of Atovaquone. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

BuPROPion: Ritonavir may decrease the serum concentration of BuPROPion. *Risk C: Monitor therapy*

BuPROPion: Lopinavir may decrease the serum concentration of BuPROPion. Concentrations of the active metabolite, hydroxybupropion, may also be decreased. *Risk C: Monitor therapy*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Codeine: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP2C19 Substrates: CYP2C19 Inducers (Strong) may increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Strong) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Darunavir: Lopinavir may decrease the serum concentration of Darunavir. Darunavir may increase the serum concentration of lopinavir *Risk X: Avoid combination*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Protease Inhibitors may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Didanosine: Lopinavir may decrease the serum concentration of Didanosine. This interaction refers only to lopinavir/ritonavir oral solution, which must be taken with food, and is principally the result of a food-didanosine interaction. Management: Didanosine should be administered 1 hour prior to or 2 hours after administration of lopinavir/ritonavir oral solution (which must be taken with food). Didanosine and lopinavir/ritonavir tablets can be administered together. *Risk D: Consider therapy modification*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of AV nodal blockade. *Risk C: Monitor therapy*

Disulfiram: May enhance the adverse/toxic effect of Ritonavir. This is specific for the lopinavir/ritonavir (Kaletra) oral solution due to its alcohol content (42%). Management: Concomitant use of Kaletra (lopinavir/ritonavir) oral solution and disulfiram should be avoided. Kaletra contains 42% alcohol. *Risk X: Avoid combination*

Dronabinol: Ritonavir may increase the serum concentration of Dronabinol. *Risk C: Monitor therapy*

Efavirenz: May decrease the serum concentration of Lopinavir. Management: An increased dose of lopinavir/ritonavir to 500mg/125mg (for tablets) or 533mg/133mg (for oral solution) twice daily is recommended when used concurrently with efavirenz. Avoid once daily use of lopinavir/ritonavir when used with efavirenz. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

Etravirine: Ritonavir may decrease the serum concentration of Etravirine. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Flecainide: Ritonavir may decrease the metabolism of Flecainide. *Risk X: Avoid combination*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

LamoTRIgine: Ritonavir may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Maraviroc: Lopinavir may increase the serum concentration of Maraviroc. Management: Reduce maraviroc dose to 150mg twice daily when maraviroc is used concurrently with lopinavir/ritonavir. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Methadone: Protease Inhibitors may decrease the metabolism of Methadone. *Risk C: Monitor therapy*

Nebivolol: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of Lopinavir. Lopinavir may decrease the serum concentration of Phenytoin. Management: The manufacturer of lopinavir/ritonavir recommends avoiding once-daily administration if used together with phenytoin. *Risk D: Consider therapy modification*

Phenytoin: May decrease the serum concentration of Ritonavir. Ritonavir may decrease the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Propafenone: Ritonavir may decrease the metabolism of Propafenone. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Silodosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: Lopinavir may enhance the nephrotoxic effect of Tenofovir. Lopinavir may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Theophylline Derivatives: Protease Inhibitors may decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Strong) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

VinBLAStine: Lopinavir may increase the serum concentration of VinBLAStine. Management: Monitor closely for signs and symptoms of vinblastine toxicity; consider temporary interruption of lopinavir/ritonavir antiviral therapy if patients develop significant toxicity with concurrent use. *Risk D: Consider therapy modification*

VinCRIStine: Lopinavir may increase the serum concentration of VinCRIStine. Management: Monitor closely for signs and symptoms of vincristine toxicity; consider temporary interruption of lopinavir/ritonavir antiviral therapy if patients develop significant toxicity with concurrent use. *Risk D: Consider therapy modification*

Voriconazole: Ritonavir may increase the metabolism of Voriconazole. High-dose ritonavir (400 mg every 12 hours) is contraindicated. Use caution with lower doses. *Risk X: Avoid combination*

Voriconazole: Lopinavir may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Warfarin: Lopinavir may decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Warfarin: Ritonavir may decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Moderate- to high-fat meals increase the C_{max} and AUC of lopinavir/ritonavir oral solution; no significant changes observed with oral tablets.

Herb/Nutraceutical: St John's wort may decrease levels of protease inhibitors and lead to possible resistance; concurrent use is contraindicated.

Monitoring ParametersTriglycerides, cholesterol, LFTs, electrolytes, basic HIV monitoring, viral load and CD4 count, glucose
Nursing: Physical Assessment/MonitoringSee individual agent for Ritonavir.
Patient EducationSee individual agent for Ritonavir.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Kaletra®: Lopinavir 80 mg and ritonavir 20 mg per mL (160 mL) [contains alcohol 42.4%]

Tablet:

Kaletra®:

Lopinavir 100 mg and ritonavir 25 mg

Lopinavir 200 mg and ritonavir 50 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Solution (Kaletra)

400-100 mg/5 mL (160): $419.98

Tablets (Kaletra)

100-25 mg (30): $99.99

200-50 mg (30): $198.99

Mechanism of ActionA coformulation of lopinavir and ritonavir. The lopinavir component is the active inhibitor of HIV protease. Lopinavir inhibits HIV protease and renders the enzyme incapable of processing polyprotein precursor which leads to production of noninfectious immature HIV particles. The ritonavir component inhibits the CYP3A metabolism of lopinavir, allowing increased plasma levels of lopinavir.
Pharmacodynamics/Kinetics

Ritonavir: See Ritonavir monograph.

Lopinavir:

Protein binding: 98% to 99%; decreased with mild-to-moderate hepatic dysfunction

Metabolism: Hepatic via CYP3A4; 13 metabolites identified

Half-life elimination: 5-6 hours

Time to peak, plasma: ~4 hours

Excretion: Feces (83%, 20% as unchanged drug); urine (10%; <3% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause abnormal dreams, agitation, amnesia, anxiety, ataxia, confusion, dizziness, emotional lability, insomnia, nervousness, somnolence, and abnormal thinking

Mental Health: Effects on Psychiatric TreatmentContraindicated with ergot derivatives, midazolam, pimozide, and triazolam. Avoid concurrent use with St John's wort; may lead to loss of virologic response and/or resistance. Dyslipidemia is common; use caution with clozapine, olanzapine, and quetiapine. Diarrhea is common; use caution with lithium, valproic acid, and SSRIs. Increased LFTs is common; use caution with olanzapine and valproic acid. May cause hyperglycemia; use caution with clozapine and olanzapine. May cause thrombocytopenia; use caution with valproic acid. Carbamazepine, phenytoin, and phenobarbital may decrease levels of lopinavir. Ritonavir may increase levels of zolpidem. The solution contains ethanol; use caution with disulfiram.

Index TermsRitonavir and Lopinavir

Pronunciation(lor AT a deen & soo doe e FED rin)
U.S. Brand NamesAlavert™ Allergy and Sinus [OTC]; Claritin-D® 12 Hour Allergy & Congestion [OTC]; Claritin-D® 24 Hour Allergy & Congestion [OTC]
Canadian Brand NamesChlor-Tripolon ND®; Claritin® Extra; Claritin® Liberator
Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation
Use: Labeled IndicationsTemporary relief of symptoms of seasonal allergic rhinitis, other upper respiratory allergies, or the common cold
Dosing: AdultsSeasonal allergic rhinitis/nasal congestion:

Oral: 1 tablet every 12 hours

Extended release: 1 tablet daily

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricSeasonal allergic rhinitis/nasal congestion: Children ≥12 years: Refer to adult dosing.
Dosing: Renal ImpairmentCl_{cr} <30 mL/minute:

Claritin-D® 12-Hour: 1 tablet daily

Claritin-D® 24-Hour: 1 tablet every other day

Dosing: Hepatic ImpairmentShould be avoided.
Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

ContraindicationsHypersensitivity to loratadine, pseudoephedrine, or any component of the formulation; use with or within 14 days of MAO inhibitors
Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Claritin-D® 24-Hour: Patients with swallowing difficulties (eg, upper GI narrowing or abnormal esophageal peristalsis) should not use Claritin-D® 24-Hour.

Other warnings/precautions:

- Self-medication (OTC use): When used for self medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever. Discontinue and contact healthcare provider if nervousness, dizziness or sleeplessness occur.

Pregnancy Risk FactorB
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/not recommended
Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsLoratadine: **Substrate** (minor) of CYP2D6, 3A4; **Inhibits** CYP2C8 (weak), 2C19 (moderate), 2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Medication Safety Issues

Sound-alike/look-alike issues:

Claritin® may be confused with clarithromycin

Pronunciation(lor AT a deen)
U.S. Brand NamesAlavert™ Allergy Relief 24-Hour [OTC]; Alavert™ [OTC]; Allergy Relief [OTC]; Claritin® 24 Hour Allergy [OTC]; Claritin® Children's Allergy [OTC]; Claritin® Children's [OTC]; Claritin® Hives Relief [OTC]; Dimetapp® ND Children's [OTC]; Loradamed [OTC]; Tavist® ND ALLERGY [OTC]
Canadian Brand NamesApo-Loratadine®; Claritin®; Claritin® Kids
Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation
Use: Labeled IndicationsRelief of nasal and non-nasal symptoms of seasonal allergic rhinitis; treatment of chronic idiopathic urticaria
Dosing: AdultsSeasonal allergic rhinitis, chronic idiopathic urticaria: Oral: 10 mg/day
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Children 2-5 years: Seasonal allergic rhinitis, chronic idiopathic urticaria: Oral: 5 mg once daily

Children ≥6 years: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} ≤30 mL/minute:

Children 2-5 years: 5 mg every other day

Children ≥6 years and Adults: 10 mg every other day

Dosing: Hepatic Impairment

Elimination half-life increases with severity of disease.

Children 2-5 years: 5 mg every other day

Children ≥6 years and Adults: 10 mg every other day

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralTake on an empty stomach.
Dietary ConsiderationsTake on an empty stomach. Alavert® and Dimetapp® Children's ND contain phenylalanine 8.4 mg per 10 mg tablet. Claritin® Children's Allergy 5 mg contains phenylalanine 1.4 mg per tablet.
StorageStore at 2°C to 25°C (36°F to 77°F).

Rapidly-disintegrating tablets: Use within 6 months of opening foil pouch, and immediately after opening individual tablet blister. Store in a dry place.

ContraindicationsHypersensitivity to loratadine or any component of the formulation
Warnings/Precautions

Disease-related concerns:

• Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended.

• Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

• Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Dosage form specific issues:

• Phenylalanine: Some products may contain phenylalanine.

Geriatric ConsiderationsLoratadine is a nonsedating antihistamines; because of its low incidence of side effects, it seems to be a good choice in the elderly. However, there is a wide variation in loratadine half-life reported in the elderly and this should be kept in mind when initiating dosing. Because of its new OTC status, patients should be advised of appropriate use.

Pregnancy Risk FactorB

Pregnancy ConsiderationsLoratadine was not found to be teratogenic in animal studies. There are no adequate and well-controlled studies in pregnant woman; use during pregnancy only if clearly needed.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Adverse Reactions

Adults:

Central nervous system: Headache (12%), somnolence (8%), fatigue (4%)

Gastrointestinal: Xerostomia (3%)

Children:

Central nervous system: Nervousness (4% ages 6-12 years), fatigue (3% ages 6-12 years, 2% to 3% ages 2-5 years), malaise (2% ages 6-12 years)

Dermatologic: Rash (2% to 3% ages 2-5 years)

Gastrointestinal: Abdominal pain (2% ages 6-12 years), stomatitis (2% to 3% ages 2-5 years)

Neuromuscular & skeletal: Hyperkinesia (3% ages 6-12 years)

Ocular: Conjunctivitis (2% ages 6-12 years)

Respiratory: Wheezing (4% ages 6-12 years), dysphonia (2% ages 6-12 years), upper respiratory infection (2% ages 6-12 years), epistaxis (2% to 3% ages 2-5 years), pharyngitis (2% to 3% ages 2-5 years)

Miscellaneous: Flu-like syndrome (2% to 3% ages 2-5 years), viral infection (2% to 3% ages 2-5 years)

Adults and Children: <2%: Agitation, altered lacrimation, altered micturition, altered salivation, altered taste, amnesia, angioneurotic edema, anorexia, anxiety, appetite increased, arthralgia, back pain, blepharospasm, blurred vision, breast pain, bronchitis, bronchospasm, chest pain, confusion, constipation, cough, depression, dermatitis, diaphoresis increased, diarrhea, dizziness, dry hair, dry skin, dysmenorrhea, dyspepsia, dysphonia, dyspnea, earache, eye pain, flatulence, flushing, gastritis, hemoptysis, hiccup, hypertension, hypertonia, hypoesthesia, hypotension, impaired concentration, impotence, insomnia, irritability, laryngitis, leg cramps, libido decreased, loose stools, malaise, menorrhagia, migraine, myalgia, nasal dryness, nausea, palpitation, paresthesia, paroniria, photosensitivity, pruritus, purpura, rigors, sinusitis, sneezing, supraventricular tachyarrhythmia, syncope, tachycardia, thirst, tinnitus, tremor, urinary discoloration, urinary incontinence, urinary retention, urticaria, vaginitis, vertigo, vomiting, weakness, weight gain

Postmarketing and/or case reports: Abnormal hepatic function, alopecia, anaphylaxis, breast enlargement, erythema multiforme, hepatitis, hepatic necrosis, jaundice, peripheral edema, seizure, thrombocytopenia

Metabolism/Transport Effects**Substrate** (minor) of CYP2D6, 3A4; **Inhibits** CYP2C8 (weak), 2C19 (moderate), 2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (although sedation is limited with loratadine, may increase risk of CNS depression).

Food: Increases bioavailability and delays peak.

Herb/Nutraceutical: St John's wort may decrease loratadine levels.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake as directed; do not exceed recommended dose. Avoid use of other depressants, alcohol, or sleep-inducing medications unless approved by prescriber. You may experience drowsiness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or dry mouth or nausea (small frequent meals, frequent mouth care, chewing gum, or sucking hard candy may help). Report persistent dizziness, sedation, or seizures; chest pain, rapid heartbeat, or palpitations; swelling of face, mouth, lips, or tongue; respiratory difficulty; changes in urinary pattern; yellowing of skin or eyes; dark urine or pale stool; or lack of improvement or worsening or condition. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Rapidly-disintegrating tablets: Place tablet on tongue; it dissolves rapidly. May be used with or without water. Use within 6 months of opening foil pouch, and immediately after opening individual tablet blister.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral: 5 mg/5 mL (120 mL)

Syrup, oral: 1 mg/mL (120 mL)

Allergy Relief: 1 mg/mL (120 mL)

Claritin® Children's: 5 mg/5 mL (60 mL, 120 mL) [alcohol free, dye free, sugar free; contains propylene glycol, sodium benzoate, and sodium 6 mg/5 mL; grape flavor]

Claritin® Children's Allergy: 1 mg/mL (120 mL) [alcohol free, dye free; contains propylene glycol and sodium benzoate; fruit flavor]

Tablet, oral: 10 mg

Alavert™: 10 mg

Claritin® 24 Hour Allergy: 10 mg

Claritin® Hives Relief: 10 mg

Loradamed: 10 mg

Tavist® ND ALLERGY: 10 mg

Tablet, chewable, oral:

Claritin® Children's Allergy: 5 mg [contains phenylalanine 1.4 mg/tablet; grape flavor]

Tablet, orally disintegrating, oral:

Alavert™ Allergy Relief 24-Hour: 10 mg [contains phenylalanine 8.4 mg/tablet]

Dimetapp® ND Children's: 10 mg [contains phenylalanine 8.4 mg/tablet]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, orally-disintegrating (Claritin Reditabs)

10 mg (10): $10.19

Tablets (Claritin)

10 mg (30): $29.99

Tablets (Loratadine)

10 mg (30): $21.99

Mechanism of ActionLong-acting tricyclic antihistamine with selective peripheral histamine H_1-receptor antagonistic properties

Pharmacodynamics/Kinetics

Onset of action: 1-3 hours

Peak effect: 8-12 hours

Duration: >24 hours

Absorption: Rapid

Distribution: Significant amounts enter breast milk

Metabolism: Extensively hepatic via CYP2D6 and 3A4 to active metabolite

Half-life elimination: 12-15 hours

Excretion: Urine (40%) and feces (40%) as metabolites

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and stomatitis in children (2-5 years).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause anxiety or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsAt recommended doses, loratadine has not been associated with clinically relevant QT prolongation or ventricular arrhythmias (eg, torsade de pointes). Loratadine has been associated with supraventricular tachyarrhythmia.

LORazepam

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

LORazepam may be confused with ALPRAZolam, clonazePAM, diazepam, temazepam

Ativan® may be confused with Atarax®, Atgam®, Avitene®

Injection dosage form contains propylene glycol. Monitor for toxicity when administering continuous lorazepam infusions.

Pronunciation(lor A ze pam)
U.S. Brand NamesAtivan®; Lorazepam Intensol®
Canadian Brand NamesApo-Lorazepam®; Ativan®; Lorazepam Injection, USP; Novo-Lorazepam; Nu-Loraz; PHL-Lorazepam; PMS-Lorazepam; Riva-Lorazepam
Pharmacologic CategoryBenzodiazepine
Use: Labeled Indications

Oral: Management of anxiety disorders or short-term (≤4 months) relief of the symptoms of anxiety or anxiety associated with depressive symptoms

I.V.: Status epilepticus, preanesthesia for desired amnesia

Use: Unlabeled/InvestigationalEthanol detoxification; insomnia; psychogenic catatonia; partial complex seizures; agitation (I.V.); antiemetic adjunct
Use: DentalShort-term relief of anxiety prior to dental appointment
Dosing: Adults

Antiemetic: Oral, I.V. (**Note:** May be administered sublingually; not a labeled route): 0.5-2 mg every 4-6 hours as needed

Anxiety and sedation: Oral: 1-10 mg/day in 2-3 divided doses; usual dose: 2-6 mg/day in divided doses; initial dose should not exceed 2 mg in debilitated patients

Insomnia: Oral: 2-4 mg at bedtime

Preoperative:

I.M.: 0.05 mg/kg administered 2 hours before surgery; maximum: 4 mg/dose

I.V.: 0.044 mg/kg 15-20 minutes before surgery; usual maximum: 2 mg/dose

Operative amnesia: I.V.: Up to 0.05 mg/kg; maximum: 4 mg/dose

Status epilepticus: I.V.: 4 mg/dose given slowly over 2-5 minutes; may repeat in 5-10 minutes; usual maximum dose: 8 mg

Rapid tranquilization of agitated patient (administer every 30-60 minutes):

Oral: 1-2 mg

I.M.: 0.5-1 mg

Average total dose for tranquilization: 4-8 mg

Agitation in the ICU patient (unlabeled):

I.V.: 0.02-0.06 mg/kg every 2-6 hours

I.V. infusion: 0.01-0.1 mg/kg/hour

Concurrent use of probenecid or valproic acid: Reduce lorazepam dose by 50%

Dosing: ElderlyAnxiety and sedation: Oral, I.V.: 0.5-4 mg/day; refer to adult dosing for other indications. Dose selection should generally be on the low end of the dosage range (ie, initial dose not to exceed 2 mg)
Dosing: Pediatric

Antiemetic: Children 2-15 years (unlabeled): I.V.: 0.05 mg/kg (up to 2 mg/dose) prior to chemotherapy

Anxiety and sedation: Infants and Children (unlabeled except for oral use in children >12 years): Oral, I.V.: Usual: 0.05 mg/kg/dose (range: 0.02-0.09 mg/kg) every 4-8 hours

Sedation (preprocedure): Infants and Children (unlabeled):

Oral, I.M., I.V.: Usual: 0.05 mg/kg; range: 0.02-0.09 mg/kg

I.V.: May use smaller doses (eg, 0.01-0.03 mg/kg) and repeat every 20 minutes, as needed to titrate to effect

Status epilepticus: I.V.:

Infants and Children (unlabeled): 0.05-0.1 mg/kg slow I.V. over 2-5 minutes, do not exceed 4 mg/single dose; may repeat second dose of 0.05 mg/kg slow I.V. in 5-10 minutes if needed

Adolescents: 0.07 mg/kg slow I.V. over 2-5 minutes; maximum: 4 mg/dose; may repeat in 5-10 minutes

Dosing: Renal ImpairmentI.V.: Risk of propylene glycol toxicity. Monitor closely if using for prolonged periods or at high doses.

Dosing: Hepatic ImpairmentUse cautiously.

Administration: I.M.Should be administered deep into the muscle mass.

Administration: I.V.Continuous infusion solutions should have an in-line filter and the solution should be checked frequently for possible precipitation. Avoid intra-arterial administration. Monitor I.V. site for extravasation.

Administration: I.V. Detail

Dilute I.V. dose with equal volume of compatible diluent (D_5W, NS, SWI).

Storage

I.V.: Intact vials should be refrigerated. Protect from light. Do not use discolored or precipitate-containing solutions. May be stored at room temperature for up to 60 days. Parenteral admixture is stable at room temperature (25°C) for 24 hours.

Tablet: Store at room temperature.

Reconstitution

Injection: Dilute with equal volume of compatible diluent (D_5W, NS, SWI).

Infusion: Use 2 mg/mL injectable vial to prepare; there may be deceased stability when using 4 mg/mL vial. Dilute ≤1 mg/mL and mix in glass bottle. Precipitation may develop. Can also be administered undiluted via infusion.

Compatibility**Variable stability (consult detailed reference)** in D_5W, LR, NS.

Y-site administration: Compatible: Acyclovir, alatrofloxacin, albumin, allopurinol, amifostine, amikacin, amphotericin B cholesteryl sulfate complex, amsacrine, atracurium, bumetanide, cefepime, cefotaxime, ciprofloxacin, cisatracurium, cisplatin, cladribine, clonidine, co-trimoxazole, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, epinephrine, erythromycin lactobionate, etomidate, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fosphenytoin, furosemide, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ketanserin, labetalol, levofloxacin, linezolid, melphalan, methotrexate, metronidazole, midazolam, milrinone, morphine, nicardipine, nitroglycerin, norepinephrine, paclitaxel, pancuronium, piperacillin, piperacillin/tazobactam, potassium chloride, propofol, ranitidine, remifentanil, tacrolimus, teniposide, thiotepa, vancomycin, vecuronium, vinorelbine, zidovudine. **Incompatible:** Aldesleukin, aztreonam, floxacillin, idarubicin, imipenem/cilastatin, omeprazole, ondansetron, sargramostim, sufentanil. **Variable (consult detailed reference):** Foscarnet, thiopental, TPN.

Compatibility in syringe: Compatible: Cimetidine, hydromorphone. **Incompatible:** Sufentanil. **Variable (consult detailed reference):** Ranitidine.

Compatibility when admixed: Incompatible: Buprenorphine, dexamethasone sodium phosphate with diphenhydramine and metoclopramide.

RestrictionsC-IV

ContraindicationsHypersensitivity to lorazepam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); acute narrow-angle glaucoma; sleep apnea (parenteral); intra-arterial injection of parenteral formulation; severe respiratory insufficiency (except during mechanical ventilation)

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Drug abuse: Use with caution in patients with a history of drug abuse, alcoholism, or significant personality disorders; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use. Risk of dependence increases with higher dosage and longer duration of therapy.
- Hepatic impairment: Use with caution in patients with hepatic impairment. Dose adjustment may be needed. May worsen hepatic encephalopathy.

- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.

- Psychiatric disorders: Use caution in patients with depression, particularly if suicidal risk may be present. Pre-existing depression may emerge or worsen during therapy. Not recommended for use in primary depressive or psychotic disorders.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease, including COPD or sleep apnea. Benzodiazepines may cause significant respiratory depression.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; initial doses should be at the lower end of dosing range.

- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury. Initial doses should at the lower end of dosing range.

- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Dosage form specific issues:

- Benzyl alcohol: Some products may contain benzyl alcohol which has been associated with "gasping syndrome" in neonates.

- Polyethylene glycol: Parenteral formulation contains polyethylene glycol. May be associated with toxicity in high dose and/or longer term therapy.

- Propylene glycol: Parenteral formulation contains propylene glycol. May be associated with toxicity in high dose and/or longer term therapy.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.

- Hypnotic: Appropriate use: As a hypnotic, should be used only after evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric or medical illness. A worsening of insomnia or the emergence of new abnormalities of thought or behavior may represent unrecognized psychiatric or medical illness and requires immediate and careful evaluation.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause acute withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsBecause lorazepam is relatively short-acting with an inactive metabolite, it is a preferred agent to use in elderly patients when a benzodiazepine is indicated.

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects have been observed in some animal studies. Lorazepam crosses the human placenta. Respiratory depression, withdrawal symptoms, or hypotonia may occur if administered late in pregnancy or near the time of delivery.

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Breast-Feeding ConsiderationsSedation and impaired nursing may occur in infants exposed to lorazepam from breast milk.

Adverse Reactions

>10%:

Central nervous system: Sedation

Respiratory: Respiratory depression

1% to 10%:

Cardiovascular: Hypotension

Central nervous system: Akathisia, amnesia, ataxia, confusion, depression, disorientation, dizziness, headache

Dermatologic: Dermatitis, rash

Gastrointestinal: Changes in appetite, nausea, weight gain/loss

Neuromuscular & skeletal: Weakness

Ocular: Visual disturbances

Respiratory: Apnea, hyperventilation, nasal congestion

<1% or frequency not defined: Asthenia, blood dyscrasias, disinhibition, euphoria, fatigue, increased salivation, menstrual irregularities,

physical and psychological dependence (with prolonged use), reflex slowing, polyethylene glycol or propylene glycol poisoning (prolonged I.V. infusion), suicidal ideation, seizure, vertigo

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Loxapine: May enhance the adverse/toxic effect of LORazepam. Specifically, prolonged stupor, respiratory depression, and/or hypotension. *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Probenecid: May decrease the metabolism of LORazepam. *Risk D: Consider therapy modification*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of LORazepam. *Risk D: Consider therapy modification*

Yohimbine: May diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status, blood pressure, heart rate, symptoms of anxiety
Reference RangeTherapeutic: 50-240 ng/mL (SI: 156-746 nmol/L)
Nursing: Physical Assessment/MonitoringAssess other medications the patient may be taking for effectiveness and interactions. **Oral:** Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. **I.V./I.M.:** Monitor vital signs and CNS status (possible retrograde amnesia with I.V.), and ability to void. Maintain bedrest for 2-3 hours, and observe when up.
Patient Education**Oral:** Take exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. Do not use alcohol or other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, confusion, depression, increased sedation, excitation, headache, agitation, insomnia or nightmares, dizziness, fatigue, impaired coordination, changes in personality, or changes in cognition); changes in urinary pattern; chest pain, palpitations, or rapid heartbeat; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances; excessive perspiration; excessive GI symptoms (cramping, constipation, vomiting, anorexia); or worsening of condition. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 2 mg/mL (1 mL, 10 mL); 4 mg/mL (1 mL, 10 mL)

Tablets (Lorazepam)

1 mg (30): $14.99

2 mg (30): $21.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Onset of action:

Hypnosis: I.M.: 20-30 minutes

Sedation: I.V.: 5-20 minutes

Anticonvulsant: I.V.: 5 minutes, oral: 30-60 minutes

Duration: 6-8 hours

Absorption: Oral, I.M.: Prompt

Distribution:

V_d: Neonates: 0.76 L/kg, Adults: 1.3 L/kg; crosses placenta; enters breast milk

Protein binding: 85%; free fraction may be significantly higher in elderly

Metabolism: Hepatic to inactive compounds

Bioavailability: Oral: 90%

Half-life elimination: Neonates: 40.2 hours; Older children: 10.5 hours; Adults: 12.9 hours; Elderly: 15.9 hours; End-stage renal disease: 32-70 hours

Time to peak: Oral: 2 hours

Excretion: Urine; feces (minimal)

Pharmacotherapy PearlsOral doses >0.09 mg/kg produced increased ataxia without increased sedative benefit vs lower doses; preferred anxiolytic when I.M. route needed. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Lorazepam is a short half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Lorazepam is rapidly and completely absorbed after I.M. injection; undergoes phase II metabolism and, therefore, is less likely to be affected in patients with hepatic dysfunction.

Cardiovascular ConsiderationsHypotension may result in orthostatic lightheadedness or syncope. Benzodiazepines, as a class, may depress respiration. These medications may often be prescribed for difficulty in sleeping but may exacerbate sleep-disordered breathing.

Anesthesia and Critical Care Concerns/Other ConsiderationsLorazepam 2 mg/mL and 4 mg/mL each contains propylene glycol 830 mg/mL (80% v/v).

Agitation in the ICU Patient: Lorazepam has a slower onset of action than midazolam or diazepam, making it less useful for treatment of acute agitation. The polyethylene glycol and propylene glycol solvents in lorazepam injection can accumulate and lead to reversible acute tubular necrosis, lactic acidosis and hyperosmolar states with prolonged, high-dose infusions. Yaucher (2003) and colleagues recently performed a retrospective review of patients who received lorazepam infusions and developed increases in serum creatinine. Eight patients from the medical-surgical intensive care unit or burn unit were evaluated. Lorazepam infusions ranged from 2-28 mg/hour. The mean cumulative dose of lorazepam was 4305 mg and the mean propylene glycol level determined at the time of peak serum creatinine concentration was 1103 mcg/mL. The duration of lorazepam infusion and magnitude of serum creatinine concentration rise correlated (r: 0.60). Propylene glycol levels strongly correlated with both serum osmolality and osmol gap. These authors suggest that serum osmolality and osmol gap may be useful markers of propylene glycol toxicity. A recent case report described a critically-ill man who developed acute tubular necrosis while receiving a lorazepam infusion and sulfamethoxazole-trimethoprim (Hayman, 2003). The addition of sulfamethoxazole-trimethoprim contributed to the development of propylene glycol toxicity.

More recently, a prospective, observational study was performed in a medical intensive care unit evaluating patients receiving high-dose lorazepam (≥10 mg/hour) infusions (Arroliga, 2004). The primary objective was to evaluate the relationship between high-dose lorazepam and serum propylene glycol concentrations. Nine patients met the criteria for entry. Baseline creatinine clearances were 50-100 mL/minute. Propylene glycol accumulation was observed in these patients receiving high-dose lorazepam infusions for ≥48 hours. A significant correlation between high-dose lorazepam infusion rate and serum propylene glycol concentrations was observed. However, osmol gap was the strongest predictor ($R^2 = 0.80$) of serum propylene glycol concentrations. Study findings suggest that in critically ill adults with normal renal function, serum propylene glycol concentrations may be predicted by the osmol gap. Based on these findings, propylene glycol accumulation may occur as early as 48 hours when using high-dose lorazepam infusions.

To calculate osmolarity: [2 x sodium (mEq/L)] + [glucose (mg/dL)/18] + [BUN (mg/dL)/2.8]

To calculate osmol gap (normal range: 0-5): (measured osmolality minus calculated osmolarity)

Lorazepam is recommended for the sedation of most patients. Use a defined endpoint in titration of the dose. Use a system to minimize prolonged sedative effects. If patient has received high-dose or >7 days of continuous therapy, consider tapering infusion to prevent withdrawal symptoms.

Status Epilepticus: A randomized, double-blind trial (Treiman, 1998) evaluated the efficacy of four treatments in overt status epilepticus. Treatment arms were designed based upon accepted practices of North American neurologists. The treatments were: 1) lorazepam 0.1 mg/kg, 2) diazepam 0.15 mg/kg followed by phenytoin 18 mg/kg, 3) phenytoin 18 mg/kg alone, and 4) phenobarbital 15 mg/kg. Treatment was considered successful if the seizures were terminated (clinically and by EEG) within 20 minutes of start of therapy without seizure recurrence within 60 minutes from the start of therapy. Patients who failed the first treatment received a second and a third, if necessary. Patients did not receive randomized treatments after the first one, but the treating physician remained blinded. Treatment success: Lorazepam 64.9%, phenobarbital 58.2%, diazepam/phenytoin 55.8%, and phenytoin alone 43.6%. Using an "intention-to-treat" analysis, there was no statistical difference between the groups. Results of subsequent treatments in patients who failed the first therapy indicated that response rate significantly dropped regardless of treatment. Aggregate response rate to the second treatment was 7.0% and third treatment 2.3%.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Hyzaar® may be confused with Cozaar®

Pronunciation(loe SAR tan & hye droe klor oh THYE a zide)

U.S. Brand NamesHyzaar®

Canadian Brand NamesHyzaar®; Hyzaar® DS

Pharmacologic CategoryAngiotensin II Receptor Blocker; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension; stroke risk reduction in patients with HTN and left ventricular hypertrophy (LVH)

Dosing: Adults**Note:** Dose is individualized (combination substituted for individual components); dose may be titrated after 2-4 weeks of therapy**Hypertension/stroke reduction in hypertension (with LVH):** Usual recommended starting dose of losartan: 50 mg once daily when used as monotherapy in patients who are not volume depleted

Dosing: ElderlyRefer to dosing in individual monographs.

Dosing: Renal Impairment Cl_{cr} ≤30 mL/minute: Use of combination formulation is not recommended.

Dosing: Hepatic ImpairmentUse is not recommended.

Calculations

- Creatinine Clearance: Adults

ContraindicationsHypersensitivity to losartan, hydrochlorothiazide, or any component of the formulation; sulfonamide-derived drugs; anuria

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hyperkalemia may occur with angiotensin II receptor antagonists; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use losartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use losartan with caution with pre-existing renal insufficiency and severe renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective); may precipitate azotemia; discontinue or consider withholding if renal impairment occurs.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- African-American patients: When used to reduce the risk of stroke in patients with HTN and LVH, may not be effective in the African-American population.

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee individual agents.
LactationEnters breast milk/contraindicated
Adverse ReactionsBased on clinical trials of the combination product in patients with essential hypertension. Also see individual agents.

1% to 10%:

Cardiovascular: Edema (1%), palpitation (1%)

Central nervous system: Dizziness (6%)

Dermatologic: Skin rash (1%)

Gastrointestinal: Abdominal pain (1%)

Neuromuscular & skeletal: Back pain (2%)

Respiratory: Upper respiratory infection (6%), cough (3%), sinusitis (1%)

<1%, postmarketing, case reports, or frequency not defined (some reactions attributed to single component): Bilirubin increased (serum), BUN increased, hematocrit decreased, hemoglobin decreased, hyper-/hypotension, hyponatremia, liver enzymes increased, rhabdomyolysis, serum creatinine increased, thrombocytopenia

Metabolism/Transport EffectsLosartan: **Substrate** (major) of CYP2C9, 3A4; **Inhibits** CYP1A2 (weak), 2C8 (moderate), 2C9 (moderate), 2C19 (weak), 3A4 (weak)
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or insomnia; may rarely cause anxiety, confusion, depression, and sleep disorders
Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the effects of losartan; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels
Cardiovascular Considerations

Congestive Heart Failure: Currently, the use of angiotensin II receptor blockers (ARBs) should not supersede angiotensin converting enzyme inhibitors (ACEIs) in the treatment of congestive heart failure. One may be considered, however, when an ACEI cannot be tolerated. Because they are angiotensin II blockers rather than inhibitors of ACE, ARBs do not cause increases in bradykinin levels. *ELITE II* (Pitt, 2000) compared losartan (50 mg/day) with captopril (150 mg/day) in a heart failure population (mean EF 31%). There were 280 deaths in the losartan group and 250 in the captopril group. Mortality was insignificantly higher for losartan (17.7% vs 16% for captopril). The secondary endpoint (sudden cardiac death or resuscitated cardiac arrest) favored captopril, but the improvement did not achieve statistical significance. The discontinuation rate for adverse events was significantly lower for losartan. In the doses used, losartan appears to be less effective or as effective as captopril.

CHARM-Alternative is a prospective, randomized trial (Granger, 2003) in ACE inhibitor-intolerant patients with CHF. Patients were randomized to candesartan (target dose: 32 mg/day; mean dose at 6 months: 23 mg/day) or placebo. Baseline characteristics included NYHA Class II or III (97% of patients), and mean LVEF 30%. Therapy included beta-blocker (55%), diuretic (86%), spironolactone (24%), and digitalis (46%). During a 33-month follow up, the combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group mainly because of reduced hospitalization. Death due to cardiovascular disease was not significantly different. There were significantly more MIs (75) in the candesartan group than in the placebo group (48). Candesartan was discontinued because of hypotension, renal dysfunction, and hyperkalemia.

Congestive Heart Failure: Concomitant ACE-I Therapy: The *Val-HeFT study* (Cohn, 2001) randomized CHF patients maintained on standard therapy to valsartan (320 mg/day; mean dose 254 mg/day) or placebo. The primary outcome was mortality and a combined endpoint of morbidity and mortality (cardiac arrest, hospitalization for CHF, need for intravenous inotrope or vasodilator). Patients (5010 in number) with predominately NYHA class II or III heart failure (85% on diuretic; 67% on digoxin; 35% on beta-blocker; ~93% on ACEI; 5% on spironolactone) were randomized to valsartan or placebo. The mean duration of follow-up was 23 months. Overall mortality was similar in both groups. The incidence of combined endpoints was lower with valsartan than placebo (p=.009) primarily because of decreased heart failure hospitalizations in the valsartan group. In a post hoc analysis of the endpoints in subgroups defined by baseline treatments (ACEI or beta-blockers), valsartan had a positive effect on patients receiving neither or one of these drugs. A higher incidence of mortality was seen in patients receiving valsartan in combination with an ACEI and a beta-blocker.

CHARM-Added trial is a prospective, randomized trial (McMurray, 2003) evaluating the addition of candesartan therapy (target dose: 32 mg/day; mean dose at 6 months: 24 mg/day) to CHF patients maintained on an ACEI. Baseline characteristics: NYHA class II (24%), class III (73%), and mean LVEF 28%. Baseline therapy was similar to CHARM-Alternative except all patients were maintained on an ACEI and ~55% were on a beta-blocker. The median duration of follow-up was 41 months. The combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group.

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Myocardial Infarction: The 2004 ACC/AHA STEMI guidelines suggest an angiotensin receptor blocker should be administered to STEMI patients who are intolerant of ACE inhibitors and who have either clinical or radiological signs of heart failure or LVEF <0.4. The *OPTIMAAL trial* evaluated whether losartan (50 mg/day) would be superior or noninferior to captopril (150 mg/day) in post-MI patients. They were randomized to one of two treatments and followed up for 2.7 years. There was no difference between the two treatment groups (499 deaths in losartan group; 447 deaths in the captopril-treated group). The VALIANT trial compared the effects of valsartan, captopril, and the combination in patients who had suffered a recent MI (0.5 to 10 days prior) complicated by left ventricular systolic dysfunction (Pfeffer, 2003). The primary endpoint was mortality from any cause. Mortality in the valsartan group and the valsartan-captopril group was similar to the captopril group alone. Valsartan was found to be noninferior to captopril in this patient population. Combining valsartan with captopril increased the rate of adverse events without improving survival. Hypotension and renal dysfunction were more common in the valsartan group. Cough, rash, and taste disturbances were more common in the captopril group.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Index Terms Hydrochlorothiazide and Losartan

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Cozaar® may be confused with Colace®, Coreg®, Hyzaar®, Zocor®

Losartan may be confused with valsartan

Pronunciation(loe SAR tan)

U.S. Brand NamesCozaar®

Canadian Brand NamesCozaar®

Pharmacologic CategoryAngiotensin II Receptor Blocker

Use: Labeled IndicationsTreatment of hypertension (HTN); treatment of diabetic nephropathy in patients with type 2 diabetes mellitus (noninsulin dependent, NIDDM) and a history of hypertension; stroke risk reduction in patients with HTN and left ventricular hypertrophy (LVH)

Use: Unlabeled/InvestigationalTo slow the rate of progression of aortic-root dilation in pediatric patients with Marfan’s syndrome

Dosing: Adults

Hypertension: Oral: Usual starting dose: 50 mg once daily; can be administered once or twice daily with total daily doses ranging from 25-100 mg

Usual initial doses in patients receiving diuretics or those with intravascular volume depletion: 25 mg once daily

Nephropathy in patients with type 2 diabetes and hypertension: Oral: Initial: 50 mg once daily; can be increased to 100 mg once daily based on blood pressure response

Stroke reduction (HTN with LVH): Oral: 50 mg once daily (maximum daily dose: 100 mg); may be used in combination with a thiazide diuretic

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Hypertension:** Oral: Children 6-16 years:

U.S. labeling: 0.7 mg/kg once daily (maximum: 50 mg/day); doses >1.4 mg/kg (maximum: 100 mg) have not been studied

Canadian labeling:

≥20 kg to <50 kg: 25 mg once daily (maximum: 50 mg once daily)

≥50 kg: 50 mg once daily (maximum: 100 mg once daily)

Aortic-root dilation with Marfan’s syndrome (unlabeled use): Children 14 months to 16 years: Initial: 0.6 mg/kg/day; can be increased to a maximum of 1.4 mg/kg/day (not to exceed adult maximum of 100 mg/day)

Dosing: Renal Impairment

Children: Use is not recommended if GFR <30 mL/minute/1.73m^2

Adults: No adjustment necessary.

Dosing: Hepatic Impairment

Children 6-16 years:

U.S. labeling: No specific dosing recommendations are provided in the approved labeling, however it may be advisable to initiate therapy at a reduced dosage.

Canadian labeling: Use is not recommended.

Adults: Reduce the initial dose to 25 mg/day

Calculations

- Creatinine Clearance: Pediatrics

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.

Extemporaneously PreparedTo prepare losartan suspension, combine 10 mL of purified water and ten (10) losartan 50 mg tablets in an 8 ounce bottle. Shake well for ≥2 minutes. Allow concentrate to stand for 1 hour then shake for 1 minute. Separately, prepare 190 mL of a 50/50 mixture of Ora-Plus™ and Ora-Sweet SF™. Add to tablet and water mixture; shake for 1 minute. Resulting 200 mL suspension will contain losartan 2.5 mg/mL. Store under refrigeration for up to 4 weeks; shake well before use.

Product information, October, 2004; Merck & Company, Inc

ContraindicationsHypersensitivity to losartan or any component of the formulation

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See "Special populations" below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely. It may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). Patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE-inhibitor therapy may be at an increased risk. Prolonged frequent monitoring may be required, especially if tongue, glottis, or larynx are involved, as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early management is critical. Intramuscular (I.M.) administration of epinephrine may be necessary.

- Hyperkalemia: May occur; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Hepatic impairment: Use with caution in patients with hepatic impairment; dose adjustment may be needed.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution with pre-existing renal insufficiency and severe renal impairment.

Special populations:

- African-American patients: When used to reduce the risk of stroke in patients with HTN and LVH, may not be effective in the African-American population.

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Geriatric ConsiderationsSerum concentrations of losartan and its metabolites are not significantly different and no initial dose adjustment is necessary even in low creatinine clearance states (<30 mL/minute). Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsMedications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects: Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the second and third trimesters. There are no adequate and well-controlled studies in pregnant women. **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if losartan is found in breast milk; the manufacturer recommends discontinuing the drug or discontinuing nursing based on the importance of the drug to the mother.

Adverse Reactions

Note: The incidence of some adverse reactions varied based on the underlying disease state. Notations are made, where applicable, for data derived from trials conducted in diabetic nephropathy and hypertensive patients, respectively.

>10%:

Cardiovascular: Chest pain (12% diabetic nephropathy)

Central nervous system: Fatigue (14% diabetic nephropathy)

Endocrine: Hypoglycemia (14% diabetic nephropathy)

Gastrointestinal: Diarrhea (2% hypertension to 15% diabetic nephropathy)

Genitourinary: Urinary tract infection (13% diabetic nephropathy)

Hematologic: Anemia (14% diabetic nephropathy)

Neuromuscular & skeletal: Weakness (14% diabetic nephropathy), back pain (2% hypertension to 12% diabetic nephropathy)

Respiratory: Cough (≤3% to 11%; similar to placebo; incidence higher in patients with previous cough related to ACE inhibitor therapy)

1% to 10%:

Cardiovascular: Hypotension (7% diabetic nephropathy), orthostatic hypotension (4% hypertension to 4% diabetic nephropathy), first-dose hypotension (dose related: <1% with 50 mg, 2% with 100 mg)

Central nervous system: Dizziness (4%), hypoesthesia (5% diabetic nephropathy), fever (4% diabetic nephropathy), insomnia (1%)

Dermatology: Cellulitis (7% diabetic nephropathy)

Endocrine: Hyperkalemia (<1% hypertension to 7% diabetic nephropathy)

Gastrointestinal: Gastritis (5% diabetic nephropathy), weight gain (4% diabetic nephropathy), dyspepsia (1% to 4%), abdominal pain (2%), nausea (2%)

Neuromuscular & skeletal: Muscular weakness (7% diabetic nephropathy), knee pain (5% diabetic nephropathy), leg pain (1% to 5%), muscle cramps (1%), myalgia (1%)

Respiratory: Bronchitis (10% diabetic nephropathy), upper respiratory infection (8%), nasal congestion (2%), sinusitis (1% hypertension to 6% diabetic nephropathy)

Miscellaneous: Infection (5% diabetic nephropathy), flu-like syndrome (10% diabetic nephropathy)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acute psychosis with paranoid delusions, ageusia, allergic reaction, alopecia, anaphylactic reactions, anemia, angina, angioedema, anorexia, anxiety, arrhythmia, arthralgia, arthritis, ataxia, AV block (second degree), bilirubin increased, blurred vision, bradycardia, bronchitis, BUN increased, confusion, conjunctivitis, constipation, CVA, depression, dermatitis, dysgeusia, dyspnea, ecchymosis, epistaxis, erythroderma, erythema, facial edema, fever, flatulence, flushing, gastritis, gout, hematocrit decreased, hemoglobin decreased, Henoch-Schönlein purpura, hepatitis, hyperkalemia, hyponatremia, hypotension, impotence, joint swelling, maculopapular rash, myositis, memory impairment, MI, migraine, muscle weakness, nervousness, orthostatic effects, pancreatitis, paresthesia, peripheral neuropathy, pharyngitis, photosensitivity, pruritus, rash, rhabdomyolysis, rhinitis, serum creatinine increased, sleep disorder, somnolence, syncope, tachycardia, taste perversion, thrombocytopenia, tinnitus, transaminases increased, tremor, urinary frequency, urticaria, vasculitis, ventricular arrhythmia, vertigo, visual acuity decreased, vomiting, xerostomia

Metabolism/Transport Effects **Substrate** (major) of CYP2C9, 3A4; **Inhibits** CYP1A2 (weak), 2C8 (moderate), 2C9 (moderate), 2C19 (weak), 3A4 (weak)

Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Losartan. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Losartan. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St John's wort may decrease levels of losartan. Avoid bayberry, blue cohosh, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh; california poppy; coleus; golden seal; hawthorn; mistletoe; periwinkle; quinine; shepherd's purse (may increase risk for hypotension). Hypoglycemic effects of losartan may be enhanced by alfalfa; aloe; bilberry; bitter melon; burdock; celery; damiana; fenugreek; garcinia; garlic; ginger; ginseng (American); gymnema; marshmallow; stinging nettle.

Monitoring ParametersSupine blood pressure, electrolytes, serum creatinine, BUN, urinalysis, symptomatic hypotension and tachycardia, CBC

Nursing: Physical Assessment/MonitoringUse caution in presence of impaired renal function, significant aortic/mitral stenosis, or history of angioedema or airway surgery. Assess potential for interactions with other pharmacological or herbal products patient may be taking (eg, decreased or increased levels/effects of losartan, risk of toxicities). Assess results of laboratory tests, therapeutic effectiveness (normotensive), and adverse response (eg, hypotension) on a regular basis during therapy. Caution patients with diabetes to monitor glucose levels closely; may alter glucose control. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsElectrolytes, serum creatinine, BUN, urinalysis, CBC

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take exactly as directed and do not discontinue without consulting prescriber. Preferable to take at same time each day without regard to meals. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. Do not use potassium supplement or salt substitutes without consulting prescriber. If you have diabetes, you may be cautioned to monitor glucose levels closely; may alter glucose control. May cause dizziness, fainting, or lightheadedness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); diarrhea (boiled milk, buttermilk, or yogurt may help). Report immediately swelling of face, lips, or mouth; difficulty swallowing; chest pain or palpitations; unrelenting headache; CNS changes (delusions or depression); or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, oral, as potassium:

Cozaar®: 25 mg [contains potassium 2.12 mg (0.054 mEq)]

Cozaar®: 50 mg [contains potassium 4.24 mg (0.108 mEq)]

Cozaar®: 100 mg [contains potassium 8.48 mg (0.216 mEq)]

50 mg (30): $71.47

100 mg (30): $92.22

Mechanism of ActionAs a selective and competitive, nonpeptide angiotensin II receptor antagonist, losartan blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; losartan interacts reversibly at the AT1 and AT2 receptors of many tissues and has slow dissociation kinetics; its affinity for the AT1 receptor is 1000 times greater than the AT2 receptor. Angiotensin II receptor antagonists may induce a more complete inhibition of the renin-angiotensin system than ACE inhibitors, they do not affect the response to bradykinin, and are less likely to be associated with nonrenin-angiotensin effects (eg, cough and angioedema). Losartan increases urinary flow rate and in addition to being natriuretic and kaliuretic, increases excretion of chloride, magnesium, uric acid, calcium, and phosphate.

Pharmacodynamics/Kinetics

Onset of action: 6 hours

Distribution: V_d: Losartan: 34 L; E-3174: 12 L; does not cross blood brain barrier

Protein binding, plasma: High

Metabolism: Hepatic (14%) via CYP2C9 and 3A4 to active metabolite, E-3174 (40 times more potent than losartan); extensive first-pass effect

Bioavailability: 25% to 33%; AUC of E-3174 is four times greater than that of losartan

Half-life elimination: Losartan: 1.5-2 hours; E-3174: 6-9 hours

Time to peak, serum: Losartan: 1 hour; E-3174: 3-4 hours

Excretion: Urine (4% as unchanged drug, 6% as active metabolite)

Clearance: Plasma: Losartan: 600 mL/minute; Active metabolite: 50 mL/minute

- Heart Failure (Systolic)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or insomnia; may rarely cause anxiety, confusion, depression, and sleep disorders
Mental Health: Effects on Psychiatric TreatmentBarbiturates may decrease the effects of losartan
Cardiovascular Considerations

Congestive Heart Failure: Currently, the use of angiotensin II receptor blockers (ARBs) should not supersede angiotensin converting enzyme inhibitors (ACEIs) in the treatment of congestive heart failure. One may be considered, however, when an ACEI cannot be tolerated. Because they are angiotensin II blockers rather than inhibitors of ACE, ARBs do not cause increases in bradykinin levels. *ELITE II* (Pitt, 2000) compared losartan (50 mg/day) with captopril (150 mg/day) in a heart failure population (mean EF 31%). There were 280 deaths in the losartan group and 250 in the captopril group. Mortality was insignificantly higher for losartan (17.7% vs 16% for captopril). The secondary endpoint (sudden cardiac death or resuscitated cardiac arrest) favored captopril, but the improvement did not achieve statistical significance. The discontinuation rate for adverse events was significantly lower for losartan. In the doses used, losartan appears to be less effective or as effective as captopril.

CHARM-Alternative is a prospective, randomized trial (Granger, 2003) in ACE inhibitor-intolerant patients with CHF. Patients were randomized to candesartan (target dose: 32 mg/day; mean dose at 6 months: 23 mg/day) or placebo. Baseline characteristics included NYHA Class II or III (97% of patients), and mean LVEF 30%. Therapy included beta-blocker (55%), diuretic (86%), spironolactone (24%), and digitalis (46%). During a 33-month follow up, the combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group mainly because of reduced hospitalization. Death due to cardiovascular disease was not significantly different. There were significantly more MIs (75) in the candesartan group than in the placebo group (48). Candesartan was discontinued because of hypotension, renal dysfunction, and hyperkalemia.

Congestive Heart Failure: Concomitant ACE-I Therapy: The *Val-HeFT study* (Cohn, 2001) randomized CHF patients maintained on standard therapy to valsartan (320 mg/day; mean dose 254 mg/day) or placebo. The primary outcome was mortality and a combined endpoint of morbidity and mortality (cardiac arrest, hospitalization for CHF, need for intravenous inotrope or vasodilator). Patients (5010 in number) with predominately NYHA class II or III heart failure (85% on diuretic; 67% on digoxin; 35% on beta-blocker; ~93% on ACEI; 5% on spironolactone) were randomized to valsartan or placebo. The mean duration of follow-up was 23 months. Overall mortality was similar in both groups. The incidence of combined endpoints was lower with valsartan than placebo (p=.009) primarily because of decreased heart failure hospitalizations in the valsartan group. In a post hoc analysis of the endpoints in subgroups defined by baseline treatments (ACEI or beta-blockers), valsartan had a positive effect on patients receiving neither or one of these drugs. A higher incidence of mortality was seen in patients receiving valsartan in combination with an ACEI and a beta-blocker.

CHARM-Added trial is a prospective, randomized trial (McMurray, 2003) evaluating the addition of candesartan therapy (target dose: 32 mg/day; mean dose at 6 months: 24 mg/day) to CHF patients maintained on an ACEI. Baseline characteristics: NYHA class II (24%), class III (73%), and mean LVEF 28%. Baseline therapy was similar to CHARM-Alternative except all patients were maintained on an ACEI and ~55% were on a beta-blocker. The median duration of follow-up was 41 months. The combined primary endpoint (CV death or heart failure hospitalizations) was significantly reduced in the candesartan group.

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Marfan's Syndrome: Marfan's syndrome is a genetic disorder due to a mutation in the gene encoding for fibrillin-1 (FBN-1) and is associated with progressive aortic root dilation and may subsequently result in aortic dissection. The deficiency of FBN-1 leads to an increase in the activity of transforming growth factor β (TGF-β) which is thought to contribute to aortic root dilation and other Marfan's syndrome characteristics. Angiotensin II receptor blockers have been shown to inhibit TGF-β signaling.

Recently, a retrospective study evaluated the use of angiotensin II receptor blockers specifically losartan (1 patient received irbesartan) in a cohort of 18 pediatric patients (age range 14 months to 16 years) with Marfan's syndrome. All patients had evidence of severe aortic root enlargement. Patients who received losartan were initiated with 0.6 mg/kg/day and increased to a maximum dose of 1.4 mg/kg/day. The patient who received irbesartan was initiated with 1.4 mg/kg/day and increased to a maximum dose of 2 mg/kg/day. Patients were followed for a median of 26 months. The mean rate of change in aortic-root diameter prior to initiation of ARB therapy was 3.54 ± 2.87 mm per year. After initiation of ARB therapy, the rate of change decreased to 0.46 ± 0.62 mm per year ($p<0.001$). A similar decline in rate of change was seen in the patient treated with irbesartan. This small cohort study demonstrates that ARB therapy in patients with aortic-root dilation due to Marfan's syndrome may be of benefit. Future randomized controlled clinical trials will be needed to confirm these findings (Brooke, 2008).

Myocardial Infarction: The 2004 ACC/AHA STEMI guidelines suggest an angiotensin receptor blocker should be administered to STEMI patients who are intolerant of ACE inhibitors and who have either clinical or radiological signs of heart failure or LVEF <0.4. The *OPTIMAAL trial* evaluated whether losartan (50 mg/day) would be superior or noninferior to captopril (150 mg/day) in post-MI patients. They were randomized to one of two treatments and followed up for 2.7 years. There was no difference between the two treatment groups (499 deaths in losartan group; 447 deaths in the captopril-treated group). The VALIANT trial compared the effects of valsartan, captopril, and the combination in patients who had suffered a recent MI (0.5 to 10 days prior) complicated by left ventricular systolic dysfunction (Pfeffer, 2003). The primary endpoint was mortality from any cause. Mortality in the valsartan group and the valsartan-captopril group was similar to the captopril group alone. Valsartan was found to be noninferior to captopril in this patient population. Combining valsartan with captopril increased the rate of adverse events without improving survival. Hypotension and renal dysfunction were more common in the valsartan group. Cough, rash, and taste disturbances were more common in the captopril group.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Anesthesia and Critical Care Concerns/Other Considerations The angiotensin II receptor antagonists appear to have similar indications as the ACE inhibitors. In heart failure, the angiotensin II antagonists are especially useful in providing an alternative therapy in those patients who have intractable cough in response to ACE inhibitor therapy. Candesartan has been studied as an alternative therapy in chronic heart failure patients who cannot tolerate an ACE-I (CHARM-Alternative) and as an added therapy in heart failure patients who are maintained on an ACE-I (CHARM-Added). In both studies, the combined endpoint of cardiovascular death or heart failure hospitalizations was significantly improved over the placebo-treated group. Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Index Terms DuP 753; Losartan Potassium; MK594

Loteprednol and Tobramycin

English

Jump To Field (Select Field Name)

Pronunciation(loe te PRED nol & toe bra MYE sin)

U.S. Brand NamesZylet™

Pharmacologic CategoryAntibiotic/Corticosteroid, Ophthalmic

Use: Labeled IndicationsTreatment of steroid-responsive ocular inflammatory conditions where either a superficial bacterial ocular infection or the risk of a superficial bacterial ocular infection exists

Dosing: AdultsOphthalmic: Instill 1-2 drops into the affected eye(s) every 4-6 hours; may increase frequency during the first 24-48 hours to every 1-2 hours. Interval should increase as signs and symptoms improve. Further evaluation should occur for use of greater than 20 mL.

Dosing: ElderlyRefer to adult dosing.

Administration: OtherContact lenses should not be worn during therapy. Shake suspension vigorously before using; instill into conjunctival sac.

StorageStore upright between 15°C to 25°C (59°F to 77°F); do not freeze.

ContraindicationsHypersensitivity to tobramycin, loteprednol, other corticosteroids, or any component of the formulation; viral, fungal, or tuberculosis diseases of the eye

Warnings/Precautions

Concerns related to adverse effects:

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.
- Ocular effects: Prolonged use of corticosteroids may result in glaucoma. Damage to the optic nerve, defects in visual acuity and fields of vision, and formation of posterior subcapsular cataract may occur.
- Sensitivity reactions: Sensitivity to tobramycin may develop; discontinue if sensitivity reaction occurs. Cross-sensitivity to other aminoglycoside antibiotics may occur.

Special populations:

- Cataract surgery patients: Use following cataract surgery may delay healing or increase the incidence of bleb formation.
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Benzalkonium chloride: Suspension contains benzalkonium chloride which may be adsorbed by contact lenses; contact lenses should not be worn during treatment of ophthalmic infections.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only. A maximum of 20 mL of suspension should be prescribed initially; patients should be evaluated prior to additional refills. Prescriptions extending beyond 14 days should include exams using magnification.

Geriatric ConsiderationsAssess patient's ability to correctly self-administer eye drops.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate or well-controlled studies in pregnant women. Use only if the potential benefit to the mother justifies the potential risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAlso see individual agents.

>10%:

Central nervous system: Headache (14%)

Ocular: Superficial punctate keratitis (15%)

4% to 10%:

Local: Burning & stinging (9%)

Ocular: Intraocular pressure increased (10%)

<4%:

Local: Discharge, itching

Ocular: Corneal deposits, eye disorders unspecified, eyelid disorder, lacrimation disorder, ocular discomfort, photophobia

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Monitoring ParametersRe-evaluate if signs and symptoms persist beyond 2 days; measure intraocular pressure if used for >10 days; culture for fungus with long-term use. Re-examine with use of >20 mL; exams for use >14 days should include magnification and (when appropriate) fluorescein staining

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Medication Safety Issues

International issues:

Lotemax® may be confused with Lotanax® which is a brand name for terfenadine in the Czech Republic

Pronunciation(loe te PRED nol)

U.S. Brand NamesAlrex®; Lotemax®

Canadian Brand NamesAlrex®; Lotemax®

Pharmacologic CategoryCorticosteroid, Ophthalmic

Use: Labeled Indications

Suspension, 0.2% (Alrex®): Temporary relief of signs and symptoms of seasonal allergic conjunctivitis

Suspension, 0.5% (Lotemax®): Inflammatory conditions (treatment of steroid-responsive inflammatory conditions of the palpebral and bulbar conjunctiva, cornea, and anterior segment of the globe such as allergic conjunctivitis, acne rosacea, superficial punctate keratitis, herpes zoster keratitis, iritis, cyclitis, selected infective conjunctivitis, when the inherent hazard of steroid use is accepted to obtain an advisable diminution in edema and inflammation) and treatment of postoperative inflammation following ocular surgery

Dosing: Adults

Seasonal allergic conjunctivitis: Ophthalmic: 0.2% suspension (Alrex®): Instill 1 drop into affected eye(s) 4 times/day.

Inflammatory conditions: Ophthalmic: 0.5% suspension (Lotemax®): Apply 1-2 drops into the conjunctival sac of the affected eye(s) 4 times/day. During the initial treatment within the first week, the dosing may be increased up to 1 drop every hour. Advise patients not to discontinue therapy prematurely. If signs and symptoms fail to improve after 2 days, re-evaluate the patient.

Postoperative inflammation: Ophthalmic: 0.5% suspension (Lotemax®): Apply 1-2 drops into the conjunctival sac of the operated eye(s) 4 times/day beginning 24 hours after surgery and continuing throughout the first 2 weeks of the postoperative period.

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to loteprednol, other corticosteroids, and any component of the formulation; viral diseases of the cornea and conjunctiva; mycobacterial infection of the eye; fungal diseases of ocular structures

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.
- Ocular effects: Prolonged use may result in glaucoma and injury to the optic nerve. Visual defects in acuity and field of vision may occur. Posterior subcapsular cataracts may form after long-term use. Use with caution in presence of glaucoma (steroids increase intraocular pressure). Perforation may occur with topical steroids in diseases which thin the cornea or sclera. Steroid use may delay healing after cataract surgery. Intraocular pressure should be monitored if this product is used >10 days.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only; patients should be re-evaluated if symptoms fail to improve after 2 days.

Geriatric ConsiderationsAssess patient's ability to administer eye drops.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Headache

Respiratory: Rhinitis, pharyngitis

1% to 10%: Ocular: Abnormal vision/blurring, burning on instillation, chemosis, dry eyes, itching, injection, conjunctivitis/irritation, corneal abnormalities, eyelid erythema, papillae uveitis

<1%: Cataract formation, changes in visual acuity and/or field defects, global perforation in disease which thins cornea or sclera, increased intraocular pressure, secondary ocular infection

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersIntraocular pressure (if >10 days)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic response and adverse effects. Teach patient proper use, side effects/appropriate interventions, and symptoms to report.

Patient EducationFor use in eyes only. Store in a cool place. Shake well before using. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Tilt head back, place medication in conjunctival sac, and close eyes. Apply finger pressure at corner of eye for 1 minute following application. May cause temporary sensitivity to bright light, blurring or stinging, changes in visual acuity, headache, runny nose, or sore throat. Do not discontinue therapy prematurely. If improvement is not noted within 2 days, notify prescriber. Report persistent vision changes, signs of increased infection, swollen eyelids, extreme itching, or if inflammation does not improve. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, ophthalmic, as etabonate:

Alrex®: 0.2% (5 mL, 10 mL) [contains benzalkonium chloride]

Lotemax®: 0.5% (2.5 mL, 5 mL, 10 mL, 15 mL) [contains benzalkonium chloride]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Suspension (Alrex)

0.2% (5): $66.13

0.2% (10): $134.27

Suspension (Lotemax)

0.5% (5): $57.32

0.5% (10): $105.32

0.5% (15): $135.41

Mechanism of ActionCorticosteroids inhibit the inflammatory response including edema, capillary dilation, leukocyte migration, and scar formation. Loteprednol is highly lipid soluble and penetrates cells readily to induce the production of lipocortins. These proteins modulate the activity of prostaglandins and leukotrienes.

Pharmacodynamics/KineticsAbsorption: None

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsLoteprednol Etabonate

Special Alerts

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Statin

Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor

Use: Labeled Indications

Adjunct to dietary therapy to decrease elevated serum total and LDL-cholesterol concentrations in primary hypercholesterolemia

Primary prevention of coronary artery disease (patients without symptomatic disease with average to moderately elevated total and LDL-cholesterol and below average HDL-cholesterol); slow progression of coronary atherosclerosis in patients with coronary heart disease

Adjunct to dietary therapy in adolescent patients (10-17 years of age, females >1 year postmenarche) with heterozygous familial hypercholesterolemia having LDL >189 mg/dL, **or** LDL >160 mg/dL with positive family history of premature cardiovascular disease (CVD), **or** LDL >160 mg/dL with the presence of at least two other CVD risk factors

Dosing: Adults

Dyslipidemia and primary prevention of CAD: Oral: Initial: 20 mg with evening meal, then adjust at 4-week intervals; maximum: 80 mg/day immediate release tablet **or** 60 mg/day extended release tablet.

Dosage modification/limits based on concurrent therapy:

Cyclosporine and other immunosuppressant drugs: Initial dose: 10 mg/day with a maximum recommended dose of 20 mg/day

Concurrent therapy with fibrates, danazol, and/or lipid-lowering doses of niacin (>1 g/day): Maximum recommended dose: 20 mg/day. Concurrent use with fibrates should be avoided unless risk to benefit favors use.

Concurrent therapy with amiodarone or verapamil: Maximum recommended dose: 40 mg/day of regular release or 20 mg/day with extended release.

Dosage adjustment in renal impairment: Cl_{cr} <30 mL/minute: Use doses >20 mg/day with caution.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Heterozygous familial hypercholesterolemia: Oral (immediate release tablet): Adolescents 10-17 years:

LDL reduction <20%: Initial: 10 mg/day with evening meal

LDL reduction ≥20%: Initial: 20 mg/day with evening meal

Usual range: 10-40 mg with evening meal, then adjust dose at 4-week intervals

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Use with caution and carefully consider doses >20 mg/day.
Administration: OralAdminister immediate release tablet with meals. Administer extended release tablet at bedtime; do not crush or chew.
Dietary ConsiderationsBefore initiation of therapy, patients should be placed on a standard cholesterol-lowering diet for 6 weeks and the diet should be continued during drug therapy. Avoid intake of large quantities of grapefruit juice (≥1 quart/day); may increase toxicity. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.
Storage

Tablet, immediate release: Store between 5°C to 30°C (41°F to 86°F). Protect from light.

Tablet, extended release: Store between 20°C to 25°C (68°F to 77°F). Avoid excessive heat and humidity.

ContraindicationsHypersensitivity to lovastatin or any component of the formulation; active liver disease; unexplained persistent elevations of serum transaminases; pregnancy; breast-feeding
Warnings/Precautions

Concerns related to adverse effects:

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Hepatic impairment and/or ethanol use: Use with caution in patients who consume large amounts of ethanol or have a history of liver disease.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors (see drug interactions); consider alternative agents that avoid or lessen potential for CYP-mediated interactions.

Special populations:

- Elderly: Use with caution in patients with advanced age, these patients are predisposed to myopathy.

- Pediatrics: Safety and efficacy of the immediate release tablet has not been evaluated in prepubertal patients, patients <10 years of age, or doses >40 mg/day; extended release tablets have not been studied in patients <20 years of age.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy.

- Liver function tests: Must be monitored by periodic laboratory assessment.

Geriatric ConsiderationsThe definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.
Pregnancy Risk FactorX
Pregnancy ConsiderationsCholesterol biosynthesis may be important in fetal development. Contraindicated in pregnancy. Administer to women of childbearing potential only when conception is highly unlikely and patients have been informed of potential hazards.
LactationExcretion unknown/contraindicated
Adverse ReactionsPercentages as reported with immediate release tablets; similar adverse reactions seen with extended release tablets.

>10%: Neuromuscular & skeletal: CPK increased (>2x normal) (11%)

1% to 10%:

Central nervous system: Headache (2% to 3%), dizziness (0.5% to 1%)

Dermatologic: Rash (0.8% to 1%)

Gastrointestinal: Abdominal pain (2% to 3%), constipation (2% to 4%), diarrhea (2% to 3%), dyspepsia (1% to 2%), flatulence (4% to 5%), nausea (2% to 3%)

Neuromuscular & skeletal: Myalgia (2% to 3%), weakness (1% to 2%), muscle cramps (0.6% to 1%)

Ocular: Blurred vision (0.8% to 1%)

<1% (Limited to important or life-threatening): Acid regurgitation, alopecia, arthralgia, chest pain, dermatomyositis, eye irritation, insomnia, leg pain, paresthesia, pruritus, vomiting, xerostomia

Additional class-related events or case reports (not necessarily reported with lovastatin therapy): Alkaline phosphatase increased, alopecia, alteration in taste, anaphylaxis, angioedema, anorexia, anxiety, arthritis, cataracts, chills, cholestatic jaundice, cirrhosis, CPK increased (>10x normal), depression, dryness of skin/mucous membranes, dyspnea, eosinophilia, erectile dysfunction, erythema multiforme, ESR increased, facial paresis, fatty liver, fever, flushing, fulminant hepatic necrosis, GGT increased, gynecomastia, hemolytic anemia, hepatitis, hepatoma, hyperbilirubinemia, hypersensitivity reaction, impaired extraocular muscle movement, impotence, leukopenia, libido decreased, malaise, memory loss, myopathy, nail changes, nodules, ophthalmoplegia, pancreatitis, paresthesia, peripheral nerve palsy, peripheral neuropathy, photosensitivity, polymyalgia rheumatica, positive ANA, pruritus, psychic disturbance, purpura, rash, renal failure (secondary to rhabdomyolysis), rhabdomyolysis, skin discoloration, Stevens-Johnson syndrome, systemic lupus erythematosus-like syndrome, thrombocytopenia, thyroid dysfunction, toxic epidermal necrolysis, transaminases increased, tremor, urticaria, vasculitis, vertigo, vomiting

Metabolism/Transport Effects **Substrate** of CYP3A4 (major); **Inhibits** CYP2C9 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Bosentan: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Danazol: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. *Risk C: Monitor therapy*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fenofibric Acid: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Sildenafil: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid excessive ethanol consumption (due to potential hepatic effects).

Food: Food **decreases** the bioavailability of lovastatin extended release tablets and **increases** the bioavailability of lovastatin immediate release tablets. Lovastatin serum concentrations may be increased if taken with grapefruit juice; avoid concurrent intake of large quantities (>1 quart/day). Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

Herb/Nutraceutical: St John's wort may decrease lovastatin levels.

Test InteractionsAltered thyroid function tests

Monitoring ParametersObtain baseline LFTs and total cholesterol profile. LFTs should also be assessed prior to upwards dosage adjustment to ≥40 mg daily or when otherwise indicated clinically. Enzyme levels should be followed periodically thereafter as clinically warranted.

Reference RangeNCEP classification of pediatric patients with familial history of hypercholesterolemia or premature CVD: Acceptable total cholesterol: <170 mg/dL, LDL: <110 mg/dL

Nursing: Physical Assessment/MonitoringUse caution with history of hepatic disease. Assess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, other lipid-lowering agents may increase risk of myopathy or rhabdomyolysis). Evaluate results of laboratory tests (LFTs and lipid profile) at baseline and periodically. Assess patient response on a regular basis throughout therapy (eg, rash, myalgia, gastrointestinal effects). Teach patient proper use (as adjunct to diet and exercise program), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to women of childbearing age unless they are capable of complying with effective contraceptive use. Instruct patient in appropriate contraceptive measures.

Monitoring: Lab TestsObtain baseline LFTs and total cholesterol profile. LFTs should be performed before initiation of therapy, at 6 and 12 weeks after initiation or first dose, and periodically thereafter.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take as directed with food at evening meal. Follow diet and exercise regimen as prescribed. You will have periodic blood tests to assess effectiveness. You may experience mild nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help); constipation (increased exercise, fruit, fluids, or fiber may help); or headache, dizziness, or insomnia (use caution when driving or engaged in potentially hazardous tasks until response to drug in known). Contact prescriber immediately with persistent muscle pain or cramping, skeletal or joint pain, or numbness. Report other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber for appropriate barrier contraceptive measures to use during and for 1 month following therapy. This drug may cause severe fetal defects. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 10 mg, 20 mg, 40 mg

Mevacor®: 20 mg, 40 mg

Tablet, extended release:

Altoprev®: 20 mg, 40 mg, 60 mg

Generic AvailableYes: Immediate release tablet

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Altoprev)

10 mg (30): $77.98

20 mg (30): $153.72

60 mg (30): $173.83

Tablets (Lovastatin)

10 mg (45): $47.99

20 mg (30): $22.99

40 mg (30): $35.99

Tables (Mevacor)

10 mg (30): $45.99

20 mg (30): $74.99

40 mg (30): $125.99

Mechanism of ActionLovastatin acts by competitively inhibiting 3-hydroxyl-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, the enzyme that catalyzes the rate-limiting step in cholesterol biosynthesis

Pharmacodynamics/Kinetics

Onset of action: LDL-cholesterol reductions: 3 days

Absorption: 30%; increased with extended release tablets when taken in the fasting state

Protein binding: 95%

Metabolism: Hepatic; extensive first-pass effect; hydrolyzed to B-hydroxy acid (active)

Bioavailability: Increased with extended release tablets

Half-life elimination: 1.1-1.7 hours

Time to peak, serum: 2-4 hours

Excretion: Feces (~80% to 85%); urine (10%)

Cardiovascular Considerations

Primary Prevention: HMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

HMG-CoA reductase inhibitors decrease C-reactive protein (CRP), an inflammatory marker and an acute phase reactant. Elevated levels of high sensitive CRP (hsCRP), which detects CRP levels as low as 0.175 mg/L, have been shown to be associated with an increased risk of cardiovascular events. Recently, the JUPITER trial demonstrated that the use of rosuvastatin in healthy patients (men ≥50 years and women ≥60 years) without a history of cardiovascular disease with LDL <130 mg/dL and a hsCRP level ≥2 mg/L reduced the risk of major cardiovascular events (eg, nonfatal MI, stroke, death from cardiovascular causes), The number needed to treat over 5 years to prevent 1 cardiovascular event is 25. Current guidelines do not recommend drug treatment for patients with an LDL <130 mg/dL. However, identification of the patient at higher risk of cardiovascular events within this subgroup using hsCRP is now important given that statins may prevent the occurrence of these serious cardiovascular events (Ridker, 2008).

Secondary Prevention: Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

In addition to the ability of HMG-CoA reductase inhibitors to decrease levels of high-sensitivity C-reactive protein (hs-CRP), they also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other Considerations

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Loxitane® may be confused with Lexapro®, Soriatane®

International issues:

Loxitane® may be confused with Lexotan® which is a brand name for bromazepam in multiple international markets

Pronunciation(LOKS a peen)

U.S. Brand Names Loxitane®

Canadian Brand Names Apo-Loxapine®; Loxapac® IM; Nu-Loxapine; PMS-Loxapine

Pharmacologic Category Antipsychotic Agent, Typical

Use: Labeled Indications Management of psychotic disorders

Use: Unlabeled/Investigational Psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Psychosis: Oral: 10 mg twice daily, increase dose until psychotic symptoms are controlled; usual dose range: 20-100 mg/day in divided doses 2-4 times/day; dosages >250 mg/day are not recommended.

Dosing: ElderlyOral: 20-60 mg/day

StorageProtect from light. Dispense in amber or opaque vials.

ContraindicationsHypersensitivity to loxapine or any component of the formulation; severe CNS depression; coma

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics. Avoid use in patients with underlying QT prolongation, in those taking medicines that prolong the QT interval, or cause polymorphic ventricular tachycardia; monitor ECG closely for dose-related QT effects.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other antipsychotics, loxapine has a low potency of cholinergic blockade.

- Blood dyscrasias: Myelosuppression (eg, leukopenia, agranulocytosis) has been observed with antipsychotic use; check blood counts periodically and discontinue at first signs of blood dyscrasias.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is moderate-high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: May be associated with pigmentary retinopathy.

- Sedation: May be sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.

- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Loxapine is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal impairment.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsMany elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

Any changes in disease status in any organ system can result in behavior changes.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Abnormal T waves with prolonged ventricular repolarization, arrhythmia, hyper-/hypotension, orthostatic hypotension, tachycardia, syncope

Central nervous system: Agitation, altered central temperature regulation, ataxia, confusion, dizziness, drowsiness, extrapyramidal reactions (akathisia, akinesia, dystonia, pseudoparkinsonism, tardive dyskinesia), faintness, headache, insomnia, lightheadedness, neuroleptic malignant syndrome (NMS), seizure, slurred speech, tension

Dermatologic: Alopecia, dermatitis, photosensitivity, pruritus, rash, seborrhea

Endocrine & metabolic: Amenorrhea, enlargement of breasts, galactorrhea, gynecomastia, menstrual irregularity

Gastrointestinal: Adynamic ileus, constipation, nausea, polydipsia, vomiting, weight gain/loss, xerostomia

Genitourinary: Sexual dysfunction, urinary retention

Hematologic: Agranulocytosis, leukopenia, thrombocytopenia

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision

Respiratory: Nasal congestion

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

LORazepam: Loxapine may enhance the adverse/toxic effect of LORazepam. Specifically, prolonged stupor, respiratory depression, and/or hypotension. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Test InteractionsFalse-positives for phenylketonuria, amylase, uroporphyrins, urobilinogen

Monitoring ParametersVital signs, orthostatic blood pressures 3-5 days after initiation of therapy or a dose increase; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS)

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions. Review ophthalmic screening laboratory results, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsLiver and kidney function, CBC prior to and at regular intervals, lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; ophthalmic screening

Patient EducationUse exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results; do not discontinue without consulting prescriber. Do not take within 2 hours of any antacid. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience excess drowsiness, restlessness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); nausea, vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); urinary retention (void before taking medication); or decreased perspiration (avoid strenuous exercise in hot environments). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; unresolved urinary retention or changes in urinary pattern; vision changes; skin rash or yellowing of skin; respiratory difficulty; or worsening of condition.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as succinate: 5 mg, 10 mg, 25 mg, 50 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Loxitane)

5 mg (60): $91.99

10 mg (60): $118.90

25 mg (60): $164.51

Mechanism of ActionLoxapine is a dibenzoxazepine antipsychotic which blocks postsynaptic mesolimbic D_1 and D_2 receptors in the brain, and also possesses serotonin 5-HT_2 blocking activity

Pharmacodynamics/Kinetics

Onset of action: Neuroleptic: Oral: 20-30 minutes

Peak effect: 1.5-3 hours

Duration: ~12 hours

Metabolism: Hepatic to glucuronide conjugates

Half-life elimination: Biphasic: Initial: 5 hours; Terminal: 12-19 hours

Excretion: Urine; feces (small amounts)

- Teratogenic Risks of Psychotropic Medications

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Significant hypotension may occur, especially when the drug is administered parenterally; orthostatic hypotension is due to alpha-receptor blockade, the elderly are at greater risk for orthostatic hypotension.

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Increased confusion, memory loss, psychotic behavior, and agitation frequently occur as a consequence of anticholinergic effects. Antipsychotic associated sedation in nonpsychotic patients is extremely unpleasant due to feelings of depersonalization, derealization, and dysphoria.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure. Loxapine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health CommentLoxapine is not commonly used. Older antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are ~15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Lubiprostone

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(loo bi PROS tone)
U.S. Brand NamesAmitiza®
Pharmacologic CategoryChloride Channel Activator; Gastrointestinal Agent, Miscellaneous
Use: Labeled IndicationsTreatment of chronic idiopathic constipation; treatment of irritable bowel syndrome with constipation in adult women
Dosing: Adults

Chronic idiopathic constipation: Adults: 24 mcg twice daily

Irritable bowel syndrome with constipation: Females ≥18 years: 8 mcg twice daily

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentHas not been studied.
Dosing: Hepatic ImpairmentHas not been studied.
Dosing: Adjustment for Toxicity

Chronic idiopathic constipation: May decrease dose to 24 mcg once daily in case of severe nausea

Administration: OralAdminister with food and water. Swallow whole; do not break or chew.
Dietary ConsiderationsMay take with food to decrease nausea.
StorageStore at controlled room temperature of 25°C (77°F).
ContraindicationsKnown or suspected mechanical bowel obstruction
Warnings/Precautions

Concerns related to adverse effects:

- Dyspnea: Often described as chest tightness, dyspnea has been observed with use, including postmarketing reports; generally occurs following the first dose with an acute onset (within 30-60 minutes following the first dose) and resolves within a few hours; however, has been frequently reported with subsequent dosing.
- Nausea: Nausea may occur; administer with food to reduce symptoms. In long-term clinical studies for chronic idiopathic constipation, patients were allowed to reduce the dose to 24 mcg once daily if nausea was severe.

Disease-related concerns:

- Diarrhea: Avoid use in patients with severe diarrhea.
- Gastrointestinal obstruction: Symptoms of mechanical gastrointestinal obstruction should be evaluated before prescribing this medicine; use is contraindicated in patients with bowel obstruction.
- Hepatic impairment: Use with caution in patients with hepatic impairment; has not been studied in hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment; has not been .studied in renal impairment.

Special populations:

- Males: Not approved for use in males with irritable bowel syndrome with constipation.
- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo studies have been done in elderly populations to date. Data in subpopulation analysis demonstrate lubiprostone is safe and well tolerated in all sexes, races, and age groups.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies suggest that lubiprostone may cause fetal loss, teratogenic effects were not observed. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should have a negative pregnancy test prior to starting therapy and should be capable of complying with effective contraception.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Central nervous system: Headache (11%)

Gastrointestinal: Nausea (8% to 29%; severe: 4%; dose related), diarrhea (7% to 12%; severe 2%)

1% to 10%:

Cardiovascular: Edema (3%), chest discomfort/pain (2%), hypertension (1%)

Central nervous system: Dizziness (3%), fatigue (2%), fever (1%), insomnia (1%)

Gastrointestinal: Abdominal pain (5% to 8%), abdominal distention (3% to 6%), flatulence (6%), vomiting (3%), loose stools (3%), dyspepsia (2%), stomach/abdominal discomfort (1% to 2%), xerostomia (1%), weight gain (1%)

Neuromuscular & skeletal: Arthralgia (3%), back pain (2%)

Renal: Urinary tract infection (4%)

Respiratory: Sinusitis (5%), upper respiratory tract infection (4%), nasopharyngitis (3%), bronchitis (2%), dyspnea (2%)

<1%, postmarketing, and/or case reports: Abnormal taste, allergic reactions, anorexia, anxiety, appetite decreased, asthma, cold sweat, constipation, cough, defecation urgency, eructation, erythema, fecal incontinence, flushing, frequent bowel movements, gastritis, heart rate increased, hyperhidrosis, hypoesthesia, influenza, joint swelling, lethargy, liver enzymes increased, malaise, muscle cramp, muscle spasm, myalgia, nervousness, pain, palpitation, paresthesia, pharyngolaryngeal pain, pollakiuria, rash, rectal hemorrhage, retching, rigors, syncope, tremor, urinary tract infection, urticaria, vertigo, viral infection, watery stools, weakness

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel:

Amitiza®: 8 mcg, 24 mcg

Generic AvailableNo
ManufacturerSucampo Pharmaceuticals, Inc
Pricing: U.S. (www.drugstore.com)

Capsules (Amitiza)

8 mcg (60): $219.98

24 mcg (30): $114.28

Mechanism of ActionBicyclic fatty acid that acts locally at the apical portion of the intestine as a chloride channel activator, increasing intestinal fluid secretion and intestinal motility. Does not alter serum sodium or potassium concentrations.
Pharmacodynamics/Kinetics

Absorption: Systemic: Parent drug: Poor (below levels of detection); Active metabolite (M3): Low

Distribution: Gastrointestinal tissue; minimal beyond gastrointestinal tissue

Metabolism: Rapid and extensive within stomach and jejunum by carbonyl reductase to M3 (active metabolite) and others

Bioavailability: Minimal

Half-life elimination: M3: 0.9-1.4 hours

Excretion: Parent drug and M3: Feces (trace amounts)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause insomnia, dizziness, depression, or anxiety
Mental Health: Effects on Psychiatric TreatmentNausea and diarrhea are common; concomitant use with SSRIs, lithium, valproic acid, and carbamazepine may produce additive effects

Lutropin Alfa

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(LOO troe pin AL fa)
U.S. Brand NamesLuveris®
Pharmacologic CategoryGonadotropin; Ovulation Stimulator
Use: Labeled IndicationsStimulation of follicular development in infertile hypogonadotropic hypogonadal (HH) women with profound luteinizing hormone (LH) deficiency; to be used in combination with follitropin alfa
Dosing: Adults**Infertility:** Females: SubQ: 75 int. units daily until adequate follicular development is noted; maximum duration of treatment: 14 days; to be used concomitantly with follitropin alfa
Administration: OtherSubQ: Administer on the stomach, a few inches above or below the navel.
StorageStore under refrigeration or at room temperature of 2°C to 25°C (36°F to 77°F). Protect from light. Use immediately after reconstitution.
ReconstitutionReconstitute with SWFI. Mix gently, do not shake.
ContraindicationsHypersensitivity to lutropin alfa or any component of the formulation; primary ovarian failure; uncontrolled thyroid or adrenal dysfunction; uncontrolled organic intracranial lesion; abnormal uterine bleeding of undetermined origin; ovarian cyst or enlargement of undetermined origin; sex hormone-dependent tumors of the reproductive tract and accessory organs; pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Ovarian enlargement: May be accompanied by abdominal distention or abdominal pain and generally regresses without treatment within 2-3 weeks. If ovaries are abnormally enlarged on the last day of treatment, withhold hCG to reduce the risk of ovarian hyperstimulation syndrome (OHSS).

- Ovarian hyperstimulation syndrome (OHSS): OHSS is characterized by severe ovarian enlargement, abdominal pain/distention, nausea, vomiting, diarrhea, dyspnea, and oliguria, and may be accompanied by ascites, pleural effusion, hypovolemia, electrolyte imbalance, hemoperitoneum, and thromboembolic events. If severe hyperstimulation occurs, stop treatment and hospitalize patient. This syndrome develops rapidly with 24 hours to several days and generally occurs during the 7-10 days immediately following treatment.

- Thromboembolism: In association with and separate from ovarian hyperstimulation syndrome (OHSS), thromboembolic events have been reported.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; safety and efficacy have not been established.

- Renal impairment: Use with caution in patients with renal impairment; safety and efficacy have not been established.

Special populations:

- Elderly: Safety and efficacy have not been established in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: To minimize risks, use only at the lowest effective dose. Monitor ovarian response with serum estradiol and vaginal ultrasound on a regular basis.

- Experienced physician: These medications should only be used by physicians who are thoroughly familiar with infertility problems and their management.

- Multiple births: May result from the use of these medications; advise patients of the potential risk of multiple births before starting the treatment.

Pregnancy Risk FactorX
Pregnancy ConsiderationsAn increase in pre- and postimplantation loss was observed in animal studies. Lutropin alfa is contraindicated for use during pregnancy.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%:

Central nervous system: Headache (10%), fatigue (2% to 3%)

Endocrine & metabolic: Ovarian hyperstimulation (6%)

Gastrointestinal: Nausea (7%), constipation (2% to 3%), diarrhea (2% to 3%)

Adverse events reported with gonadotropin or menotropin therapy: Adnexal torsion, arterial thromboembolism, congenital abnormalities, ectopic pregnancy, hemoperitoneum, ovarian enlargement (mild-to-moderate), ovarian neoplasms (infrequent), postpartum fever, premature labor, pulmonary complications, spontaneous abortion, vascular complications

Drug InteractionsThere are no known significant interactions.

Monitoring Parameters

Prior to therapy: Baseline LH <1.2 int. units/L, FSH <5 int. units/L, negative progestin challenge test

During therapy: Signs and symptoms of OHSS, ovarian enlargement; follicular maturation (vaginal ultrasound, serum estradiol levels); ovulation (basal body temperature, serum progesterone, menstruation)

Nursing: Physical Assessment/MonitoringThis medication should only be prescribed by a fertility specialist. For subcutaneous use only. Administer around navel area. Instruct patient in appropriate administration technique and disposal of used needles and syringes. **Pregnancy risk factor X:** Pregnancy must be excluded before starting medication. Consult prescriber if breast-feeding.

Patient EducationFor subcutaneous injection only. Follow administration schedule as directed by prescriber. Do not alter dosage or miss a dose. If a dose is missed, notify prescriber. You may experience headache, nausea (small frequent meals, frequent oral care, sucking lozenges, or chewing gum may help), fatigue, constipation, or diarrhea. Report immediately abdominal pain/distension, persistent nausea. **Pregnancy/breast-feeding precautions:** Pregnancy must be excluded before starting medication. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Luveris®: 75 int. units [contains sucrose; packaged with SWFI]

Generic AvailableNo

ManufacturerSerono, Inc

Mechanism of ActionLutropin alfa is a recombinant luteinizing hormone prepared using Chinese hamster cell ovaries. Administration leads to increased follicular estradiol secretion needed for follicle stimulating hormone induced follicular development.

Pharmacodynamics/Kinetics

Distribution: V_d: 10

Bioavailability: 56% ± 23%

Half-life elimination: Terminal: ~18 hours

Time to peak, serum: 4-16 hours

Excretion: Urine (<5% unchanged)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue

Mental Health: Effects on Psychiatric TreatmentMay cause GI side effects; concurrent use with SSRIs, lithium, or valproic acid may produce additive GI effects

Index Termsr-hLH; Recombinant Human Luteinizing Hormone

International Brand NamesLuver-I.S. (MX); Luveris (AR, AU, BE, BR, CH, CZ, DE, DK, EE, ES, FI, GB, HK, ID, IE, IL, IT, KP, NL, NO, PH, PL, PT, SE, SG, TW, UY, VE)

English

Jump To Field (Select Field Name)

Pronunciation(em-KREE sil AS e tate)
U.S. Brand NamesCresylate速
Pharmacologic CategoryOtic Agent, Anti-infective
Use: Labeled IndicationsProvides an acid medium; for external otitis infections caused by susceptible bacteria or fungus
Dosing: AdultsOtitis externa: Otic: Instill 2-4 drops as required
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, otic: 25% (15 mL) [with isopropanol 25%, chlorobutanol 1%, benzyl alcohol 1%, and castor oil 5% in propylene glycol]

Generic AvailableNo
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

M-VAC (Bladder Cancer)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pharmacologic CategoryChemotherapy Regimen, Bladder Cancer
Regimen UseBladder cancer
RegimenNOTE: Multiple variations are listed below.

Variation 1:

Methotrexate: I.V.: 30 mg/m^2/day days 1, 15, and 22

[total dose/cycle = 90 mg/m^2]

Vinblastine: I.V.: 3 mg/m^2/day days 2, 15, and 22

[total dose/cycle = 9 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 2

[total dose/cycle = 30 mg/m^2]

Cisplatin: I.V.: 70 mg/m^2 day 2

[total dose/cycle = 70 mg/m^2]

Repeat cycle every 4 weeks

Variation 2:

Methotrexate: I.V.: 40 or 50 mg/m^2/day days 1, 15, and 22

[total dose/cycle = 120 or 150 mg/m^2]

Vinblastine: I.V.: 4 or 5 mg/m^2/day days 2, 15, and 22

[total dose/cycle = 12 or 15 mg/m^2]

Doxorubicin: I.V.: 40 or 50 mg/m^2 day 2

[total dose/cycle = 40 or 50 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 2

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 4 weeks

Variation 3:

Methotrexate: I.V.: 30 mg/m^2/day days 1, 15, and 22

[total dose/cycle = 90 mg/m^2]

Vinblastine: I.V.: 3 mg/m^2 day 2

[total dose/cycle = 3 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 2

[total dose/cycle = 30 mg/m^2]

Cisplatin: I.V.: 70 mg/m^2 day 2

[total dose/cycle = 70 mg/m^2]

Repeat cycle every 4 weeks

Variation 4:

Methotrexate: I.V.: 60 mg/m^2 day 1

[total dose/cycle = 60 mg/m^2]

followed by I.V.: 30 mg/m^2 day 16

[total dose/cycle = 30 mg/m^2]

Vinblastine: I.V.: 4 mg/m^2/day days 2 and 16

[total dose/cycle = 8 mg/m^2]

Doxorubicin: I.V.: 60 mg/m^2 day 2

[total dose/cycle = 60 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 2

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 23 days

Variation 5:

Methotrexate: I.V.: 30 mg/m^2/day days 1, 16, and 23

[total dose/cycle = 90 mg/m^2]

Vinblastine: I.V.: 4 mg/m^2/day days 1, 16, and 23

[total dose/cycle = 12 mg/m^2]

Doxorubicin: I.V.: 60 mg/m^2 day 2

[total dose/cycle = 60 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 2

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 23 days

Variation 6:

Methotrexate: I.V.: 30 or 35 mg/m^2 day 1

[total dose/cycle = 30 or 35 mg/m^2]

Vinblastine: I.V.: 3 or 3.5 mg/m^2 day 2

[total dose/cycle = 3 or 3.5 mg/m^2]

Doxorubicin: I.V.: 30 or 35 mg/m^2 day 2

[total dose/cycle = 30 or 35 mg/m^2]

Cisplatin: I.V.: 70 or 80 mg/m^2 day 2

[total dose/cycle = 70 or 80 mg/m^2]

Repeat cycle every 2 weeks

Variation 7:

Methotrexate: I.V.: 30 mg/m^2 day 1

[total dose/cycle = 30 mg/m^2]

Vinblastine: I.V.: 3 mg/m^2 day 2

[total dose/cycle = 3 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 2

[total dose/cycle = 30 mg/m^2]

Cisplatin: I.V.: 70 mg/m^2 day 2

[total dose/cycle = 70 mg/m^2]

Repeat cycle every 14 days

Variation 8:

Methotrexate: I.V.: 30 mg/m^2/day days 1, 15, and 22

[total dose/cycle = 90 mg/m^2]

Vinblastine: I.V.: 3 mg/m^2/day days 1, 15, and 22

[total dose/cycle = 9 mg/m^2]

Doxorubicin: I.V.: 45 mg/m^2 day 2

[total dose/cycle = 45 mg/m^2]

Cisplatin: I.V.: 70 mg/m^2 day 2

[total dose/cycle = 70 mg/m^2]

Repeat cycle every 4 weeks

Variation 9:

Methotrexate: I.V.: 40 mg/m^2/day days 1 and 15

[total dose/cycle = 80 mg/m^2]

Vinblastine: I.V.: 4 mg/m^2/day days 1, 16, and 23

[total dose/cycle = 12 mg/m^2]

Doxorubicin: I.V.: 60 mg/m^2 day 2

[total dose/cycle = 60 mg/m^2]

Cisplatin: I.V.: 100 mg/m^2 day 2

[total dose/cycle = 100 mg/m^2]

Repeat cycle every 23 days

Variation 10:

Methotrexate: I.V.: 30 mg/m^2/day days 1, 15, and 22

[total dose/cycle = 90 mg/m^2]

Vinblastine: I.V.: 3 mg/m^2/day days 1, 16, and 22

[total dose/cycle = 9 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 1

[total dose/cycle = 30 mg/m^2]

Cisplatin: I.V.: 70 mg/m^2 day 1

[total dose/cycle = 70 mg/m^2]

Repeat cycle every 4 weeks

Variation 11:

Methotrexate: I.V.: 30 mg/m^2/day days 1, 15, and 22

[total dose/cycle = 90 mg/m^2]

Vinblastine: I.V.: 3 mg/m^2/day days 2, 15, and 22

[total dose/cycle = 9 mg/m^2]

Doxorubicin: I.V.: 30 mg/m^2 day 2

[total dose/cycle = 30 mg/m^2]

Cisplatin: I.V.: 70 mg/m^2 day 2

[total dose/cycle = 70 mg/m^2]

Leucovorin: Oral: 15 mg every 6 hours for 4 doses, days 2, 16, and 23

[total dose/cycle = 180 mg]

Repeat cycle every 4 weeks

Variation 12:

Methotrexate: I.V.: 30 mg/m^2/day days 1 and 15

[total dose/cycle = 60 mg/m^2]

Vinblastine: I.V.: 3 mg/m^2/day days 2 and 15

[total dose/cycle = 6 mg/m^2]

Doxorubicin: I.V.: 30 or 40 mg/m^2 day 3

[total dose/cycle = 30 or 40 mg/m^2]

Cisplatin: I.V.: 70 mg/m^2 day 2

[total dose/cycle = 70 mg/m^2]

Repeat cycle every 4 weeks

Variation 13:

Methotrexate: I.V.: 30 mg/m^2/day days 1 and 15

[total dose/cycle = 60 mg/m^2]

Vinblastine: I.V.: 3 mg/m^2/day days 2 and 15

[total dose/cycle = 6 mg/m^2]

Doxorubicin: I.V.: 30 or 40 mg/m^2 day 2

[total dose/cycle = 30 or 40 mg/m^2]

Cisplatin: I.V.: 70 mg/m^2 day 2

[total dose/cycle = 70 mg/m^2]

Repeat cycle every 4 weeks

Mafenide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(MA fe nide)
U.S. Brand NamesSulfamylon®
Pharmacologic CategoryAntibiotic, Topical
Use: Labeled Indications

Cream: Adjunctive antibacterial agent in the treatment of second- and third-degree burns

Solution: Adjunctive antibacterial agent for use under moist dressings over meshed autografts on excised burn wounds

Dosing: AdultsBurns: Topical:

Cream: Apply once or twice daily with a sterile-gloved hand; apply to a thickness of approximately $^{1}/_{16}$ inch; the burned area should be covered with cream at all times

Solution: Cover graft area with 1 layer of fine mesh gauze. Wet an 8-ply burn dressing with mafenide solution and cover graft area. Keep dressing wet using syringe or irrigation tubing every 4 hours (or as necessary), or by moistening dressing every 6-8 hours (or as necessary). Irrigation dressing should be secured with bolster dressing and wrapped as appropriate. May leave dressings in place for up to 5 days.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Dosing: Adjustment for Toxicity

Acidosis: Discontinuing treatment for 24-48 hours may aid in restoring acid-base balance

Administration: TopicalCream: Keep burn area covered with cream at all times; use thinner layer if dressings are used. Apply to clean debrided area with a sterile gloved hand
Storage

Cream: Avoid exposure to excessive heat, >40°C (>104°F).

Powder: Prior to reconstitution, store powder at room temperature of 15°C to 30°C (59°F to 86°F). Store prepared solution at 20°C to 25°C (68°F to 77°F); may store at room temperature for limited periods. Solution may be stored in unopened containers for up to 28 days; once container is open, discard unused portion within 48 hours.

Reconstitution Powder: To prepare a 5% topical solution, add mafenide 50 g to 1000 mL of NS for irrigation or sterile water for irrigation. Mix until dissolved.
ContraindicationsHypersensitivity to mafenide or any component of the formulation
Allergy Considerations

- Sulfonamide Antibiotic Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Sulfonamide allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- G6PD deficiency: Use caution in patients with G6PD deficiency; may increase risk of DIC or hemolytic anemia

- Renal impairment: Use with caution in patients with renal impairment; accumulation of parent drug and metabolite may enhance carbonic anhydrase inhibition and increase risk of metabolic acidosis.

Dosage forms specific issues:

- Sulfites: Some dosage forms contain sulfites which may cause allergic reactions in certain individuals.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies using an oral preparation. Safety and efficacy have not been established in pregnant women. The manufacturer does not recommended use in women of childbearing potential unless the burn area

covers >20% of the total body surface or when benefits of treatment outweigh possible risks to the fetus.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, facial edema

Dermatologic: Erythema, maceration, pruritus, rash, urticaria

Endocrine & metabolic: Hyperchloremia, metabolic acidosis

Gastrointestinal: Diarrhea (following accidental ingestion)

Hematologic: Bleeding, bone marrow suppression, DIC, eosinophilia, hemolytic anemia, porphyria

Local: Blisters, burning sensation, excoriation, pain

Respiratory: Dyspnea, hyperventilation, pCO_2 decreased, tachypnea

Miscellaneous: Hypersensitivity

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersAcid base balance; signs of infection; signs of healing
Nursing: Physical Assessment/MonitoringSee Warnings/Precautions and Contraindications for use cautions. Assess for effectiveness of therapy and symptoms of infection. Assess knowledge/teach patient appropriate application and use and adverse symptoms (see Adverse Reactions) to report. **Pregnancy risk factor C.** Note breast-feeding caution.
Monitoring: Lab TestsAcid-base balance
Patient EducationFor external use only. Apply exactly as directed with sterile-gloved hand so that burned areas are covered with cream at all times. Avoid getting in eyes. Report facial swelling, skin rash, unusual bleeding, respiratory difficulty, persistent diarrhea, or signs of infections. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical:

Sulfamylon®: 85 mg/g (60 g, 120 g, 454 g) [contains sodium metabisulfite]

Powder, for topical solution, as acetate:

Sulfamylon®: 50 g/packet (5s)

Generic AvailableNo
Mechanism of ActionAs a sulfonamide, mafenide interferes with bacterial folic acid synthesis through competitive inhibition of para-aminobenzoic acid. Spectrum of activity encompasses both gram positive and negative organisms, including *Pseudomonas* and some anaerobes.
Pharmacodynamics/Kinetics

Absorption: Diffuses through devascularized areas and is rapidly absorbed from burned surface

Metabolism: To para-carboxybenzene sulfonamide; mafenide and metabolite are carbonic anhydrase inhibitors

Time to peak, serum: Cream 11%: 2-4 hours

Burn tissue: Cream 11%: 2 hours, Solution 5%: 4 hours

Excretion: Urine (as metabolites)

Related Information

- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Riopan Plus® may be confused with Repan®

Pronunciation(MAG al drate & sye METH i kone)
U.S. Brand NamesRiopan Plus® Double Strength [OTC] [DSC]; Riopan Plus® [OTC] [DSC]
Pharmacologic CategoryAntacid; Antiflatulent
Use: Labeled IndicationsRelief of hyperacidity associated with peptic ulcer, gastritis, peptic esophagitis, and hiatal hernia which are accompanied by symptoms of gas
Dosing: Adults**Hyperacidity/gas:** Oral: 5-10 mL (540-1080 mg magaldrate) between meals and at bedtime
Dosing: ElderlyRefer to adult dosing.
Dietary ConsiderationsShould be taken on empty stomach.
Contraindications

Based on **magaldrate** component: Hypersensitivity to magaldrate or any component of the formulation; patients with colostomy or an ileostomy; appendicitis; ulcerative colitis; diverticulitis

Based on **simethicone** component: Hypersensitivity to simethicone or any component of the formulation

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/compatible
Adverse ReactionsFrequency not defined.

Based on **magaldrate** component:

Central nervous system: Encephalopathy

Gastrointestinal: Constipation, chalky taste, stomach cramps, fecal impaction, diarrhea, nausea, vomiting, discoloration of feces (white speckles), rebound hyperacidity

Endocrine & metabolic: Hypophosphatemia, hypermagnesemia, milk-alkali syndrome

Neuromuscular & metabolic: Osteomalacia

Miscellaneous: Aluminum intoxication

Based on **simethicone** component: No data reported

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C:*

Monitor therapy

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Mesalamine: Antacids may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids. *Risk X: Avoid combination*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Patient EducationSee individual agent for Simethicone.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension, oral: Magaldrate 540 mg and simethicone 20 mg per 5 mL (360 mL)

Riopan Plus®: Magaldrate 540 mg and simethicone 20 mg per 5 mL (360 mL) [DSC]

Riopan Plus® Double Strength: Magaldrate 1080 mg and simethicone 40 mg per 5 mL (360 mL) [DSC]

Generic AvailableYes

English

Jump To Field (Select Field Name)

Pronunciation(mag NEE zhum KLOR ide)
U.S. Brand NamesChloromag®; Mag 64™ [OTC]; Mag Delay® [OTC]; Slow-Mag® [OTC]
Pharmacologic CategoryElectrolyte Supplement, Oral; Electrolyte Supplement, Parenteral; Magnesium Salt
Use: Labeled IndicationsCorrection or prevention of hypomagnesemia; dietary supplement
Dosing: Adults**Note:** Serum magnesium is poor reflection of repletional status as the majority of magnesium is intracellular; serum levels may be transiently normal for a few hours after a dose is given, therefore, aim for consistently high normal serum levels in patients with normal renal function for most efficient repletion.

Dietary supplement: Oral (Mag 64™, Mag Delay®, Slow-Mag®): 2 tablets once daily

Parenteral nutrition supplementation: I.V. (elemental magnesium): 8-24 mEq/day

RDA (elemental magnesium):

19-30 years:

Female: 310 mg/day

Pregnant female: 350 mg/day

Male: 400 mg/day

≥31 years:

Female: 320 mg/day

Pregnant female: 360 mg/day

Male: 420 mg/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Note:** Serum magnesium is poor reflection of repletional status as the majority of magnesium is intracellular; serum levels may be transiently normal for a few hours after a dose is given, therefore, aim for consistently high normal serum levels in patients with normal renal function for most efficient repletion.

Parenteral nutrition supplementation: I.V. (elemental magnesium):

<50 kg: 0.3-0.5 mEq/kg/day

>50 kg: 10-30 mEq/day

RDA (elemental magnesium):

1-3 years: 80 mg/day

4-8 years: 130 mg/day

9-13 years: 240 mg/day

14-18 years:

Female: 360 mg/day

Pregnant female: 400 mg/day

Male: 410 mg/day

Dosing: Renal Impairment Cl_{cr} <30 mL/minute: Use with caution; monitor for hypermagnesemia
Dietary ConsiderationsWhole grains, legumes, and dark-green leafy vegetables are dietary sources of magnesium.
StorageInjection: Prior to reconstitution, store at controlled room temperature of 15°C to 30°C (59°F to 86°F).
ReconstitutionDilute magnesium chloride 4 g in 250 mL D_5W.
ContraindicationsHypersensitivity to any component of the formulation; renal impairment; myocardial disease; coma
Warnings/Precautions

Disease-related concerns:

- Neuromuscular disease: Use with extreme caution in patients with myasthenia gravis or other neuromuscular disease.
- Renal impairment: Use with caution in patients with renal impairment; accumulation of magnesium may lead to magnesium intoxication.

Special populations:

- Obstetrics: Vigilant monitoring and safe administration techniques (ISMP Medication Safety Alert, 2005) recommended to avoid potential for errors resulting in toxicity. Monitor patient and fetal status, and serum magnesium levels closely.

Dosage form specific issues:

- Aluminum: Solutions may contain aluminum; toxic levels may occur following prolonged administration in premature neonates or patients with renal impairment.

Other warnings/precautions:

- Electrolyte abnormalities: Concurrent hypokalemia or hypocalcemia can accompany a magnesium deficit. Hypomagnesemia is associated with hypokalemia and requires correction in order to normalize potassium.
- Parenteral administration: Monitor serum magnesium level, respiratory rate, blood pressure, deep tendon reflex, and renal function when administered parenterally, particularly with repeated dosing; magnesium toxicity can lead to fatal cardiovascular arrest and/or respiratory paralysis.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Magnesium crosses the placenta; serum levels in the fetus correlate with those in the mother.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsMagnesium is found in breast milk. The amount is not influenced by dietary intake under normal conditions.

Adverse ReactionsFrequency not defined: Gastrointestinal: Diarrhea (excessive oral doses)

Drug Interactions

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Eltrombopag: Magnesium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., magnesium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Monitoring Parameters

I.V.: Rapid administration: ECG monitoring, vital signs, deep tendon reflexes; magnesium, calcium, and potassium levels; renal function during administration

Oral: Renal function; magnesium levels; bowel movements

Reference RangeSerum magnesium: 1.5-2.5 mg/dL; slightly different ranges are reported by different laboratories

Monitoring: Lab Tests

Magnesium, calcium, potassium, and renal function

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 200 mg/mL [1.97 mEq/mL] (50 mL)

Chloromag®: 200 mg/mL [1.97 mEq/mL] (50 mL)

Tablet [enteric coated]:

Slow-Mag®: Elemental magnesium 64 mg [contains elemental calcium 106 mg]

Tablet, delayed release:

Mag 64™, Mag Delay®: Magnesium chloride hexahydrate 535 mg [equivalent to elemental magnesium 64 mg; contains elemental calcium 110 mg]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Slow-Mag)

64 mg (60): $18.99

Mechanism of ActionMagnesium is important as a cofactor in many enzymatic reactions in the body involving protein synthesis and carbohydrate metabolism (at least 300 enzymatic reactions require magnesium). Actions on lipoprotein lipase have been found to be important in reducing serum cholesterol and on sodium/potassium ATPase in promoting polarization (eg, neuromuscular functioning).

Pharmacodynamics/Kinetics

Absorption: Oral: Inversely proportional to amount ingested; 40% to 60% under controlled dietary conditions; 15% to 36% at higher doses

Distribution: Bone (50% to 60%); extracellular fluid (1% to 2%)

Protein binding: 30%, to albumin

Excretion: Urine (as magnesium)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Magnesium products may prevent GI absorption of tetracyclines by forming a large ionized chelated molecule with the tetracyclines in the stomach. Tetracyclines should be given at least 1 hour before magnesium.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause somnolence

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

International Brand NamesSlow-Mag (PL); Solural (MX)

Magnesium Citrate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(mag NEE zhum SIT rate)

U.S. Brand NamesCitroma® [OTC]

Canadian Brand NamesCitro-Mag®

Pharmacologic CategoryLaxative, Saline; Magnesium Salt

Use: Labeled IndicationsEvacuation of bowel prior to certain surgical and diagnostic procedures or overdose situations

Dosing: AdultsCathartic: Oral: Adults: $^1/_2$ to 1 full bottle (120-300 mL)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricCathartic: Oral: Children:

<6 years: 0.5 mL/kg up to a maximum of 200 mL repeated every 4-6 hours until stools are clear

6-12 years: 100-150 mL

≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentPatients in severe renal failure should not receive magnesium due to toxicity from accumulation. Patients with a Cl_{cr} <25 mL/minute should be monitored by serum magnesium levels.

Administration: OralTo increase palatability, chill the solution prior to administration.

Dietary ConsiderationsCitroma® 290 mg/5 mL (300 mL) cherry and lemon flavors contains magnesium 48 mg and potassium 13 mg per 5 mL; Citroma® grape and lemony flavors contains magnesium 48 mg and sodium 7.5 mg per 5 mL

ContraindicationsRenal failure, appendicitis, abdominal pain, intestinal impaction, obstruction or perforation, diabetes mellitus, complications in gastrointestinal tract, patients with colostomy or ileostomy, ulcerative colitis or diverticulitis

Warnings/Precautions

Disease-related concerns:

- Constipation (self-medication, OTC use): Appropriate use: For occasional use only; serious side effects may occur with prolonged use. For use only under the supervision of a healthcare provider in patients with kidney dysfunction, or with a sudden change in bowel habits which persist for >2 weeks. Do not use if abdominal pain, nausea, or vomiting are present.
- Neuromuscular disease: Use with extreme caution in patients with myasthenia gravis or other neuromuscular disease.
- Renal impairment: Use with caution in patients with renal impairment; accumulation of magnesium may lead to magnesium intoxication.

Geriatric ConsiderationsElderly, due to disease or drug therapy, may be predisposed to diarrhea. Diarrhea may result in electrolyte imbalance. Decreased renal function (Cl_{cr} <30 mL/minute) may result in toxicity; monitor for toxicity and Cl_{cr} <30 mL/minute.

Pregnancy Risk FactorB

Adverse Reactions1% to 10%:

Cardiovascular: Hypotension

Endocrine & metabolic: Hypermagnesemia

Gastrointestinal: Abdominal cramps, diarrhea, gas formation

Respiratory: Respiratory depression

Drug Interactions

Aluminum Hydroxide: Citric Acid Derivatives may increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Eltrombopag: Magnesium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., magnesium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Test InteractionsIncreased magnesium; decreased protein, decreased calcium (S), decreased potassium (S)

Reference RangeSerum magnesium: 1.5-2.5 mg/dL; slightly different ranges are reported by different laboratories

Nursing: Physical Assessment/MonitoringAssess therapeutic response and adverse effects.

Patient EducationTake with a glass of water, fruit juice, or citrus-flavored carbonated beverage to improve taste. Chill before using. Report severe abdominal pain to prescriber.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral: 290 mg/5 mL (300 mL) [cherry and lemon flavors]

Citroma®: 290 mg/5 mL (300 mL) [contains magnesium 48 mg and potassium 13 mg per 5 mL; cherry and lemon flavors]; (300 mL) [contains magnesium 48 mg and sodium 7.5 mg per 5 mL; grape and lemony flavors]

Tablet: 100 mg [as elemental magnesium]

Generic AvailableYes

Mechanism of ActionPromotes bowel evacuation by causing osmotic retention of fluid which distends the colon with increased peristaltic activity

Pharmacodynamics/Kinetics

Absorption: Oral: 15% to 30%

Excretion: Urine

Magnesium Glucoheptonate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(mag NEE zhum gloo koh HEP toh nate)

Canadian Brand NamesMagnelium®; Magnolex®; Magnorol® Sirop; ratio-Magnesium

Pharmacologic CategoryMagnesium Salt

Use: Labeled IndicationsTreatment and prevention of hypomagnesemia

Dosing: AdultsThe recommended dietary allowance (RDA) of magnesium is 4.5 mg/kg which is a total daily allowance of 350-400 mg for adult men and 280-300 mg for adult women. During pregnancy the RDA is 300 mg and during lactation the RDA is 355 mg. Average daily intakes of dietary magnesium have declined in recent years due to processing of food.

Note: Serum magnesium is poor reflection of repletional status as the majority of magnesium is intracellular; serum levels may be transiently normal for a few hours after a dose is given, therefore, aim for consistently high normal serum levels in patients with normal renal function for most efficient repletion

Hypomagnesemia: Oral: 100-600 mg (5-30 mg elemental magnesium) 1-2 times/day with food.

Maintenance electrolyte requirements:

Daily requirements: 0.2-0.5 mEq/kg/24 hours or 3-10 mEq/1000 kcal/24 hours

Maximum: 8-16 mEq/24 hours

Dosing adjustment/comments in renal impairment: Cl_{cr} <25 mL/minute: Do not administer or monitor serum magnesium levels carefully.

Dosing: ElderlyRefer to adult dosing.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMagnesium glucoheptonate oral solution: Mix with water and administer on an empty stomach. 100 mg magnesium glucoheptonate = 0.42 mEq magnesium = 5 mg elemental magnesium

RestrictionsNot available in U.S.

ContraindicationsHeart block, serious renal impairment, myocardial damage, hepatitis, Addison's disease

Warnings/Precautions

Disease-related concerns:

- Constipation (self-medication, OTC use): Appropriate use: For occasional use only; serious side effects may occur with prolonged use. For use only under the supervision of a healthcare provider in patients with kidney dysfunction, or with a sudden change in bowel habits which persist for >2 weeks. Do not use if abdominal pain, nausea, or vomiting are present.
- Neuromuscular disease: Use with extreme caution in patients with myasthenia gravis or other neuromuscular disease.
- Renal impairment: Use with caution in patients with renal impairment; accumulation of magnesium may lead to magnesium intoxication.

Geriatric Considerations

Elderly, due to disease or drug therapy, may be predisposed to diarrhea. Diarrhea may result in electrolyte imbalance. Decreased renal function (Cl_{cr} <30 mL/minute) may result in toxicity; monitor for toxicity and Cl_{cr} <30 mL/minute.

Adverse ReactionsAdverse effects on neuromuscular function may occur at lower levels in patients with neuromuscular disease (eg, myasthenia gravis).

Serum magnesium levels >3 mg/dL:

Central nervous system: Depressed CNS

Gastrointestinal: Diarrhea

Neuromuscular & skeletal: Blocked peripheral neuromuscular transmission leading to anticonvulsant effects

Serum magnesium levels >5 mg/dL:

Cardiovascular: Flushing

Central nervous system: Somnolence

Serum magnesium levels >12.5 mg/dL:

Cardiovascular: Complete heart block, cardiac conduction affected

Respiratory: Respiratory paralysis

Drug Interactions

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Eltrombopag: Magnesium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., magnesium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Test InteractionsIncreased magnesium; decreased protein, calcium (S), decreased potassium (S)

Monitoring ParametersSerum magnesium levels should be monitored to avoid overdose; monitor for diarrhea

Reference RangeSerum magnesium: 1.5-2.5 mg/dL; slightly different ranges are reported by different laboratories

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Magnelium®, Magnorol®: 20 mg [contains 20 mg elemental magnesium]

Magnolex®: 300 mg [contains 15 mg elemental magnesium]

Solution, oral (ratio-Magnesium): 100 mg/mL (500 mL, 2000 mL) [contains 5 mg/mL elemental magnesium]

Syrup (Magnorol® Sirop): 90 mg/mL (400 mL) [contains 4.5 mg/mL elemental magnesium]

Generic AvailableYes

Mechanism of ActionWhen taken orally, magnesium promotes bowel evacuation by causing osmotic retention of fluid which distends the colon with increased peristaltic activity; parenterally, magnesium decreases acetylcholine in motor nerve terminals and acts on myocardium by slowing rate of S-A node impulse formation and prolonging conduction time.

Pharmacodynamics/KineticsExcretion: Urine (as magnesium)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Magnesium products may prevent GI absorption of tetracyclines by forming a large ionized chelated molecule with the tetracyclines in the stomach. Tetracyclines should be given at least 1 hour before magnesium.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation or CNS depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive CNS depression

Anesthesia and Critical Care Concerns/Other ConsiderationsHypomagnesemia can hinder the replenishment of intracellular potassium and should be corrected in order to correct hypokalemia.

Index TermsMagnesium Gluceptate

Pronunciation(mag NEE zhum GLOO koe nate)

U.S. Brand NamesAlmora® [OTC]; Mag G® [OTC]; Magonate® [OTC]; Magtrate® [OTC]

Pharmacologic CategoryElectrolyte Supplement, Oral; Magnesium Salt

Use: Labeled IndicationsDietary supplement

Dosing: Adults**RDA (elemental magnesium):** Oral:

19-30 years:

- Female: 310 mg/day
- Pregnant female: 350 mg/day
- Male: 400 mg/day

≥31 years:

- Female: 320 mg/day
- Pregnant female: 360 mg/day
- Male: 420 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**RDA (elemental magnesium):** Oral:

1-3 years: 80 mg/day

4-8 years: 130 mg/day

9-13 years: 240 mg/day

14-18 years:

- Female: 360 mg/day
- Pregnant female: 400 mg/day
- Male: 410 mg/day

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Use with caution; monitor for hypermagnesemia

Administration: OralAdminister on an empty stomach

Dietary ConsiderationsWhole grains, legumes, and dark-green leafy vegetables are dietary sources of magnesium.

ContraindicationsHypersensitivity to any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Constipation (self-medication, OTC use): Appropriate use: For occasional use only; serious side effects may occur with prolonged use. For use only under the supervision of a healthcare provider in patients with kidney dysfunction, or with a sudden change in bowel habits which persist for >2 weeks. Do not use if abdominal pain, nausea, or vomiting are present.
- Neuromuscular disease: Use with extreme caution in patients with myasthenia gravis or other neuromuscular disease.
- Renal impairment: Use with caution in patients with renal impairment; accumulation of magnesium may lead to magnesium intoxication.

Pregnancy ConsiderationsMagnesium crosses the placenta; serum levels in the fetus correlate with those in the mother.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsMagnesium is found in breast milk. The amount is not influenced by dietary intake under normal conditions.

Adverse ReactionsFrequency not defined: Gastrointestinal: Diarrhea (excessive oral doses)

Drug Interactions

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of

Calcium Channel Blockers. *Risk C: Monitor therapy*

Eltrombopag: Magnesium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., magnesium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Reference RangeSerum magnesium: 1.5-2.5 mg/dL; slightly different ranges are reported by different laboratories

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution:

Magonate®: 1000 mg/5 mL (355 mL) [magnesium 4.8 mEq/5 mL; equivalent to elemental magnesium 54 mg/5 mL; contains sodium benzoate]

Tablet: 500 mg [magnesium 2.4 mEq; equivalent to elemental magnesium 27 mg]

Almora®, Mag G®, Magonate®, Magtrate®): 500 mg [magnesium 2.4 mEq; equivalent to elemental magnesium 27 mg]

Generic AvailableYes: Tablet

Mechanism of ActionMagnesium is important as a cofactor in many enzymatic reactions in the body involving protein synthesis and carbohydrate metabolism (at least 300 enzymatic reactions require magnesium). Actions on lipoprotein lipase have been found to be important in reducing serum cholesterol and on sodium/potassium ATPase in promoting polarization (eg, neuromuscular functioning).

Pharmacodynamics/Kinetics

Absorption: Oral: Inversely proportional to amount ingested; 40% to 60% under controlled dietary conditions; 15% to 36% at higher doses

Distribution: Bone (50% to 60%); extracellular fluid (1% to 2%)

Protein binding: 30%, to albumin

Excretion: Urine (as magnesium)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Magnesium products may prevent GI absorption of tetracyclines by forming a large ionized chelated molecule with the tetracyclines in the stomach. Tetracyclines should be given at least 1 hour before magnesium.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Magnesium Hydroxide and Mineral Oil

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(mag NEE zhum hye DROKS ide & MIN er al oyl)

U.S. Brand NamesPhillips'® M-O [OTC]

Pharmacologic CategoryLaxative

Use: Labeled IndicationsShort-term treatment of occasional constipation

Dosing: AdultsLaxative: OTC labeling: Oral: 45-60 mL at bedtime

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricLaxative: OTC labeling: Oral:

Children <6 years: Use not recommended

Children 6-11 years: 20-30 mL at bedtime

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentPatients in severe renal failure should not receive magnesium due to toxicity from accumulation. Patients with a Cl_{cr} <30 mL/minute should be monitored by serum magnesium levels.

Administration: OralShake well before using. Do not take with meals. Dose should be followed by 8 oz of liquid.

Dietary ConsiderationsPhillips'® M-O contains magnesium 125 mg and sodium 1.5 mg per 5 mL

ContraindicationsHypersensitivity magnesium hydroxide, mineral oil, or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Renal impairment: Use magnesium with caution in patients with severe renal impairment (especially when doses are >50 mEq magnesium/day); hypermagnesemia and toxicity may occur due to decreased renal clearance of absorbed magnesium. Decreased renal function (Cl_{cr} <30 mL/minute) may result in toxicity; monitor for toxicity.

Other warnings/precautions:

- Self-medication (OTC use): Patients should notify healthcare provider of any sudden change in bowel habits which last >14 days, stomach pain, nausea, vomiting, or if use is needed for >1 week. Not for OTC use in children <6 years of age, in pregnant or bedridden patients, or patients with dysphagia. Avoid concomitant use with stool softener laxatives.

Geriatric ConsiderationsThe use of mineral oil products may be hazardous in the elderly with conditions predisposing them to aspiration. Elderly, due to disease or drug therapy, may be predisposed to diarrhea. Diarrhea may result in electrolyte imbalance. Decreased renal function (Cl_{cr} <30 mL/minute) may result in toxicity from magnesium absorption; monitor for toxicity.

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Antacids may decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of

Calcium Channel Blockers. *Risk C: Monitor therapy*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

Eltrombopag: Magnesium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., magnesium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Fexofenadine: Antacids may decrease the serum concentration of Fexofenadine. Management: No specific recommendations concerning the time required between their administration are provided. Separate administration of each agent by as much time as possible to decrease the risk of an interaction. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Mesalamine: Antacids may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids. *Risk X: Avoid combination*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral:

Phillips'® M-O: Magnesium hydroxide 300 mg and mineral oil 1.25 mL per 5 mL (360 mL, 780 mL) [contains magnesium 125 mg and sodium 1.5 mg per 5 mL mint flavors]

Generic AvailableNo
Pharmacodynamics/Kinetics

Onset of action: Laxative: 30 minutes to 6 hours hours

Excretion: Magnesium: Urine (up to 30% as absorbed magnesium ions); feces (as unabsorbed drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Magnesium products may prevent GI absorption of tetracyclines by forming a large ionized chelated molecule with the tetracyclines in the stomach. Tetracyclines should be given at least 1 hour before magnesium.

Jump To Field (Select Field Name)

Pronunciation(mag NEE zhum hye DROKS ide)

U.S. Brand NamesPhillips'® Chews [OTC]; Phillips'® Milk of Magnesia [OTC]

Pharmacologic CategoryAntacid; Laxative; Magnesium Salt

Use: Labeled IndicationsShort-term treatment of occasional constipation and symptoms of hyperacidity, laxative; dietary supplement

Dosing: Adults

Antacid: OTC labeling: Oral:

Liquid: Magnesium hydroxide 400 mg/5 mL: 5-15 mL as needed up to 4 times/day

Tablet: Magnesium hydroxide 311 mg/tablet: 2-4 tablets every 4 hours up to 4 times/day

Dietary supplement: OTC labeling (Phillips'® Chews): Oral: Magnesium 500 mg: 2-4 tablets/day once daily at bedtime or in divided doses

Laxative: OTC labeling: Oral:

Liquid:

Magnesium hydroxide 400 mg/5 mL: 30-60 mL/day once daily at bedtime or in divided doses

Magnesium hydroxide 800 mg/5 mL: 15-30 mL/day once daily at bedtime or in divided doses

Tablet: Magnesium hydroxide 311 mg/tablet: 8 tablets/day once daily at bedtime or in divided doses

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Antacid: OTC labeling: Oral:

Liquid: Children ≥12 years: Refer to adult dosing.

Tablet:

Children <12 years: Use not recommended.

Children ≥12 years: Refer to adult dosing.

Dietary supplement: OTC labeling (Phillips'® Chews): Oral:

Children <12 years: Use not recommended.

Children ≥12 years: Refer to adult dosing.

Laxative: Oral:

Liquid: Magnesium hydroxide 400 mg/5 mL: 1-3 mL/kg/day; adjust dose to induce daily bowel movement

OTC labeling:

Children <2 years: Use not recommended.

Children 2-5 years: Magnesium hydroxide 400 mg/5 mL: 5-15 mL/day once daily at bedtime or in divided doses

Children 6-11 years:

Magnesium hydroxide 400 mg/5 mL: 15-30 mL/day once daily at bedtime or in divided doses

Magnesium hydroxide 800 mg/5 mL: 7.5-15 mL/day once daily at bedtime or in divided doses

Children ≥12 years: Refer to adult dosing.

Tablet: OTC labeling:

Children <3 years: Use not recommended.

Children 3-5 years: Magnesium hydroxide 311 mg/tablet: 2 tablets/day once daily at bedtime or in divided doses

Children 6-11 years: Magnesium hydroxide 311 mg/tablet: 4 tablets/day once daily at bedtime or in divided doses

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentPatients in severe renal failure should not receive magnesium due to toxicity from accumulation. Patients with a Cl_{cr} <30 mL/minute should be monitored by serum magnesium levels.

Administration: OralLiquid doses may be diluted with a small amount of water prior to administration. All doses should be followed by 8 ounces of water.

Dietary Considerations

Liquid (400 mg/5 mL) contains magnesium 167 mg/5 mL.

Phillips'® Chews contain magnesium 500 mg/tablet, sodium 10 mg/tablet, coconut oil and soybean oil

Phillips'® Milk of Magnesia cherry flavor liquid contains sodium 2 mg/5 mL

Phillips'® Milk of Magnesia chewable tablets contain magnesium 130 mg/tablet

ContraindicationsHypersensitivity to magnesium hydroxide or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Neuromuscular disease: Use with extreme caution in patients with myasthenia gravis or other neuromuscular disease.
- Renal impairment: Use with caution in patients with renal impairment; accumulation of magnesium may lead to magnesium intoxication.

Other warnings/precautions:

- OTC use: For occasional use only; serious side effects may occur with prolonged use. For use only under the supervision of a healthcare provider in patients with kidney dysfunction, or with a sudden change in bowel habits which persist for >2 weeks. Do not use if abdominal pain, nausea, or vomiting are present. Patients should notify healthcare provider of any sudden change in bowel habits which last >14 days, stomach pain, nausea, or vomiting or if use is needed for >1 week. Not for OTC use in children <2 years of age.

Geriatric ConsiderationsElderly, due to disease or drug therapy, may be predisposed to diarrhea. Diarrhea may result in electrolyte imbalance. Decreased renal function (Cl_{cr} <30 mL/minute) may result in toxicity; monitor for toxicity.

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Test InteractionsIncreased magnesium; decreased protein, calcium (S), decreased potassium (S)
Reference RangeSerum magnesium: 1.5-2.5 mg/dL; slightly different ranges are reported by different laboratories
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, oral: 400 mg/5 mL (360 mL, 480 mL, 960 mL, 3780 mL)

Phillips'® Milk of Magnesia: 400 mg/5 mL (120 mL, 360 mL, 780 mL) [contains magnesium 167 mg/5 mL, cherry flavor also contains sodium 2 mg/5 mL; original, cherry, and mint flavors]

Liquid, oral concentrate: 800 mg/5 mL (100 mL, 400 mL)

Phillips'® Milk of Magnesia [concentrate]: 800 mg/5 mL (240 mL) [strawberry flavor]

Tablet, chewable:

Phillips'® Chews: Magnesium 500 mg [contains sodium 10 mg/tablet, coconut oil and soybean oil; chocolate flavor]

Phillips'® Milk of Magnesia: 311 mg [contains magnesium 130 mg/tablet; mint flavor]

Generic AvailableYes: Liquid
Pricing: U.S. (www.drugstore.com)

Suspension (Milk of Magnesia)

400 mg/5 mL (480): $12.00

Mechanism of ActionPromotes bowel evacuation by causing osmotic retention of fluid which distends the colon with increased peristaltic activity; reacts with hydrochloric acid in stomach to form magnesium chloride

Pharmacodynamics/Kinetics

Onset of action: Laxative: 30 minutes to 6 hours

Excretion: Urine (up to 30% as absorbed magnesium ions); feces (as unabsorbed drug)

Pharmacologic CategoryElectrolyte Supplement, Oral; Magnesium Salt

Use: Labeled IndicationsDietary supplement

Dosing: Adults

RDA (elemental magnesium):

- 19-30 years:
    - Female: 310 mg/day
    - Pregnant female: 350 mg/day
    - Male: 400 mg/day
- ≥31 years:
    - Female: 320 mg/day
    - Pregnant female: 360 mg/day
    - Male: 420 mg/day

Dietary supplement: Oral: Magnesium-L-aspartate 1230 mg (magnesium 122 mg) up to 3 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

RDA (elemental magnesium):

- 1-3 years: 80 mg/day
- 4-8 years: 130 mg/day
- 9-13 years: 240 mg/day
- 14-18 years:
    - Female: 360 mg/day
    - Pregnant female: 400 mg/day
    - Male: 410 mg/day

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Use with caution; monitor for hypermagnesemia

Administration: Oral

Granules: Mix each packet in 4 ounces of water or juice prior to administration

Tablet, enteric coated: Do not crush or chew

Dietary ConsiderationsTake with food. Whole grains, legumes, and dark-green leafy vegetables are dietary sources of magnesium.

ContraindicationsHypersensitivity to any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Constipation (self-medication, OTC use): Appropriate use: For occasional use only; serious side effects may occur with prolonged use. For use only under the supervision of a healthcare provider in patients with kidney dysfunction, or with a sudden change in bowel habits which persist for >2 weeks. Do not use if abdominal pain, nausea, or vomiting are present.
- Neuromuscular disease: Use with extreme caution in patients with myasthenia gravis or other neuromuscular disease.
- Renal impairment: Use with caution in patients with renal impairment; accumulation of magnesium may lead to magnesium intoxication.

Geriatric ConsiderationsElderly, due to disease or drug therapy, may be predisposed to diarrhea. Diarrhea may result in electrolyte imbalance. Decreased renal function (Cl_{cr} <30 mL/minute) may result in toxicity; monitor for toxicity. Monitor for signs of confusion or worsening signs of dementia.

Pregnancy ConsiderationsMagnesium crosses the placenta; serum levels in the fetus correlate with those in the mother.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsMagnesium is found in breast milk. The amount is not influenced by dietary intake under normal conditions.

Adverse ReactionsFrequency not defined: Gastrointestinal: Diarrhea (excessive oral doses)

Drug Interactions

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Eltrombopag: Magnesium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., magnesium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Reference RangeSerum magnesium: 1.5-2.5 mg/dL; slightly different ranges are reported by different laboratories

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Granules:

Maginex™ DS: 1230 mg/packet (30s) [magnesium 10 mEq; equivalent to magnesium 122 mg; lemon flavor]

Tablet [enteric coated]:

Maginex™: 615 mg [magnesium 5 mEq; equivalent to magnesium 61 mg]

Generic AvailableNo

ManufacturerGeist Pharmaceuticals, LLC

Pricing: U.S. (www.drugstore.com)

Tablet, EC (Maginex)

615 mg (30): $17.99

Mechanism of ActionMagnesium is important as a cofactor in many enzymatic reactions in the body involving protein synthesis and carbohydrate metabolism (at least 300 enzymatic reactions require magnesium). Actions on lipoprotein lipase have been found to be important in reducing serum cholesterol and on sodium/potassium ATPase in promoting polarization (eg, neuromuscular functioning).

Pharmacodynamics/Kinetics

Absorption: Oral: Inversely proportional to amount ingested; 40% to 60% under controlled dietary conditions; 15% to 36% at higher doses. Absorption of the Maginex™ formulation may be increased compared to other magnesium salts.

Distribution: Bone (50% to 60%); extracellular fluid (1% to 2%)

Protein binding: 30%, to albumin

Excretion: Urine (as magnesium)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Magnesium ions prevent GI absorption of tetracycline by forming a large, ionized, chelated molecule with the magnesium ion and tetracyclines in the stomach. Magnesium supplement should not be taken within 2-4 hours of oral tetracycline or other members of the tetracycline family.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause diarrhea; concomitant use with lithium, valproic acid, and SSRIs may produce additive effects. Diarrhea may lead to dehydration and alteration of serum lithium levels; monitor.

Magnesium Salicylate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(mag NEE zhum sa LIS i late)

U.S. Brand NamesDoan's® Extra Strength [OTC]; Keygesic [OTC]; Momentum® [OTC]; Novasal™

Pharmacologic CategorySalicylate

Use: Labeled IndicationsMild-to-moderate pain, fever, various inflammatory conditions; relief of pain and inflammation of rheumatoid arthritis and osteoarthritis

Dosing: Adults

Relief of mild-to-moderate pain:

Doan's® Extra Strength, Momentum®: Two caplets every 6 hours as needed (maximum: 8 caplets/24 hours)

Keygesic: One tablet every 4 hours as needed (maximum 4 tablets/24 hours)

Treatment of arthritis (Novasal™): Initial: 1 tablet 3-4 times/day. Maximum: 8 tablets/day

Dosing: ElderlyTreatment of arthritis (Novasal™): Refer to adult dosing. Reduce adult dose to lowest effective dose; monitor for signs of toxicity.

Dosing: Pediatric**Relief of mild-to-moderate pain:** Children ≥12 years: Refer to adult dosing.

Administration: OralAdminister with a full glass of water.

ContraindicationsHypersensitivity to magnesium salicylate, salicylates, other NSAIDs, or any component of the formulation; advanced chronic renal dysfunction; concomitant use with uricosuric agents

In patients ≥65 years of age: Also contraindicated with a history of chronic salicylate use, carditis, chronic liver dysfunction

Allergy Considerations

- Salicylate Allergy/Sensitivity

Warnings/Precautions

Boxed warnings:

- Hepatic impairment: See “Disease-related concerns” below.
- Hypoprothrombinemia/vitamin K deficiency: See “Disease-related concerns” below.
- Surgical patients: See “Special populations” below.

Concerns related to adverse effects:

- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.
- Tinnitus: Discontinue use if tinnitus or impaired hearing occurs.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with bleeding disorders.
- Dehydration: Use with caution in patients with dehydration.
- Ethanol use: Heavy ethanol use (>3 drinks/day) can increase bleeding risks.
- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer.
- Hepatic impairment: **[U.S. Boxed Warning]: Use with caution in patients with hepatic impairment;** avoid in severe impairment.
- Hypoprothrombinemia/vitamin K deficiency: **[U.S. Boxed Warning]: Use high doses with caution in patients with hypoprothrombinemia and/or vitamin K deficiency.**
- Renal impairment: Use with caution in patients with renal impairment; avoid use in severe impairment.

Special populations:

- Elderly: The lowest effective dose should be used in patients ≥65 years of age.

- Pediatrics: Children and teenagers who have or are recovering from chickenpox or flu-like symptoms should not use this product. Changes in behavior (along with nausea and vomiting) may be an early sign of Reye's syndrome; patients should be instructed to contact their healthcare provider if these occur. Safety and efficacy have not been established in children <12 years of age.

- Surgical patients: **[U.S. Boxed Warning]: Use with caution prior to surgery;** surgical patients should avoid salicylates if possible, for 1-2 weeks prior to surgery, to reduce the risk of excessive bleeding.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSpecific reproduction studies have not been conducted with this agent. Refer to Aspirin monograph for additional information.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsSalicylates are excreted into human milk. Breast-feeding is not recommended by the manufacturer. Refer to Aspirin monograph for additional information.

Adverse ReactionsRefer to Aspirin monograph.

Drug Interactions

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Eltrombopag: Magnesium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., magnesium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsRefer to Aspirin monograph.

Reference RangeTherapeutic range of salicylate for arthritis treatment: 20-30 mg/dL

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet, as anhydrous: 467 mg

Doan's® Extra Strength: 467 mg

Momentum®: 467 mg

Tablet, chelated:

Keygesic: 650 mg

Tablet, as tetrahydrate [scored]:

Novasal™: 600 mg

Generic AvailableYes

Pharmacodynamics/Kinetics

Absorption: Rapid from stomach and upper intestine

Distribution: Readily into most body fluids and tissues; crosses the placenta, enters breast milk

Protein binding: 50% to 90%; primarily albumin

Metabolism: Released into the plasma as salicylic acid which is enzymatically converted to salicyluric acid and salicylphenolic glucuronide

Half-life elimination: 2 hours; increased with repeated dosing

Time to peak: 1.5 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Magnesium Sulfate

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Magnesium sulfate may be confused with manganese sulfate, morphine sulfate

$MgSO_4$ is an error-prone abbreviation (mistaken as morphine sulfate)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V. formulation) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(mag NEE zhum SUL fate)

Pharmacologic Category[Anticonvulsant, Miscellaneous](); [Electrolyte Supplement, Parenteral](); [Magnesium Salt]()

Use: Labeled IndicationsTreatment and prevention of hypomagnesemia; prevention and treatment of seizures in severe pre-eclampsia or eclampsia, pediatric acute nephritis; torsade de pointes; treatment of cardiac arrhythmias (VT/VF) caused by hypomagnesemia; soaking aid

Use: Unlabeled/Investigational

Asthma exacerbation (life-threatening)

Dosing: AdultsDose represented as magnesium sulfate unless stated otherwise. **Note:** Serum magnesium is poor reflection of repletional status as the majority of magnesium is intracellular; serum levels may be transiently normal for a few hours after a dose is given, therefore, aim for consistently high normal serum levels in patients with normal renal function for most efficient repletion.

Note: 1 g of magnesium sulfate = 98.6 mg elemental magnesium = 8.12 mEq elemental magnesium

Hypomagnesemia:Note: Treatment depends on severity and clinical status:

Mild deficiency: I.M.: 1 g every 6 hours for 4 doses, or as indicated by serum magnesium levels

Severe deficiency:

I.M.: Up to 250 mg/kg within a 4-hour period

I.V.: Severe, non-life-threatening: 1-2 g/hour for 3-6 hours then 0.5-1 g/hour as needed to correct deficiency

Symptomatic deficiency: I.V.: 1-2 g over 5-60 minutes; maintenance infusion may be required to correct deficiency (0.5-1 g/hour).

Arrhythmia (ACLS guidelines, 2005), hypomagnesemia-induced (life-threatening): 1-2 g over 5-20 minutes (torsades with cardiac arrest) or over 5-60 minutes (symptomatic arrhythmias without cardiac arrest)

Seizures, hypomagnesemia-induced: I.V.: 2 g over 10 minutes; calcium administration may also be appropriate as many patients are also hypocalcemic.

Asthma (life-threatening or severe exacerbation after 1 hour of intensive conventional therapy; unlabeled use): I.V.: 2 g

Eclampsia:

I.V.: 4-5 g infusion; followed by a 1-2 g/hour continous infusion; or may follow with I.M. doses of 4-5 g in each buttock every 4 hours. **Note:** Initial infusion may be given over 3-4 minutes if eclampsia is severe; maximum: 40 g/24 hours

ACOG Practice Bulletin 2002: 4-6 g over 15-20 minutes followed by 2 g/hour continuous infusion

Pre-eclampsia (severe): I.V. 4-5 g infusion; followed by a 1-2 g/hour continous infusion; or may follow with I.M. doses of 4-5 g in each buttock every 4 hours; maximum: 40 g/24 hour

Torsade de pointes: I.V.:

Pulseless: 1-2 g over 5-20 minutes

With pulse: 1-2 g over 5-60 minutes. **Note:** Slower administration preferable for stable patients.

Parenteral nutrition supplementation: I.V.: 8-24 mEq elemental magnesium/day

Soaking aid: Topical: Dissolve 2 cupfuls of powder per gallon of warm water

RDA:

19-30 years:

Female: 310 mg elemental magnesium/day

Pregnant female: 350 mg elemental magnesium/day

Male: 400 mg elemental magnesium/day

≥31 years:

Female: 320 mg elemental magnesium/day

Pregnant female: 360 mg elemental magnesium/day

Male: 420 mg elemental magnesium/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricDose represented as magnesium sulfate unless stated otherwise. **Note:** Serum magnesium is poor reflection of repletional status as the majority of magnesium is intracellular; serum levels may be transiently normal for a few hours after a dose is given, therefore, aim for consistently high normal serum levels in patients with normal renal function for most efficient repletion.

Note: 1 g of magnesium sulfate = 98.6 mg elemental magnesium = 8.12 mEq elemental magnesium

Hypomagnesemia:Note: Treatment depends on severity and clinical status: I.V., I.O.: 25-50 mg/kg/dose over 10-20 minutes (faster in cardiac arrest); maximum single dose: 2000 mg

Asthma (life-threatening or severe exacerbation after 1 hour of intensive conventional therapy; unlabeled use): I.V.: 25-75 mg/kg (maximum: 2 g)

Parenteral nutrition supplementation: I.V.:

<50 kg: 0.3-0.5 mEq elemental magnesium/kg/day

>50 kg: 10-30 mEq elemental magnesium/day

RDA: Children:

1-3 years: 80 mg elemental magnesium/day

4-8 years: 130 mg elemental magnesium/day

9-13 years: 240 mg elemental magnesium/day

14-18 years:

Female: 360 mg elemental magnesium/day

Pregnant female: 400 mg elemental magnesium/day

Male: 410 mg elemental magnesium/day

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Use with caution; monitor for hypermagnesemia; do not exceed 20 g/48 hours as per manufacturer. Close monitoring is required.

Calculations

- Magnesium Sulfate

Administration: I.M.A 25% or 50% concentration may be used for adults and dilution to a ≤20% solution is recommended for children

Administration: I.V.Magnesium should be diluted to a ≤20% solution for I.V. infusion and may be administered IVP, IVPB or I.V.; when giving I.V. push, must dilute first and should not be given any faster than 150 mg/minute. Hypotension and asystole may occur with rapid administration.

Maximal rate of infusion: 2 g/hour to avoid hypotension; doses of 4 g/hour have been given in emergencies (eclampsia, seizures); optimally, should add magnesium to I.V. fluids, but bolus doses are also effective

Administration: Topical

Dissolve 2 cups of powder per gallon of warm water to use as a soaking aid. To make a compress, dissolve 2 cups of powder per 2 cups of hot water and use a towel to apply as a wet dressing.

Dietary ConsiderationsWhole grains, legumes and dark-green leafy vegetables are dietary sources of magnesium.

10% elemental magnesium; 8.1 mEq magnesium/g; 4 mmol magnesium/g

500 mg magnesium sulfate = 4.06 mEq magnesium = 49.3 mg elemental magnesium

StoragePrior to use, store at room temperature of 20°C to 25°C (68°F to 77°F). Refrigeration of solution may result in precipitation or crystallization.

CompatibilityStable in D_5W, LR, NS; **incompatible** with fat emulsion 10%

Y-site administration: Compatible: Acyclovir, aldesleukin, amifostine, amikacin, ampicillin, aztreonam, cefamandole, cefazolin, cefoperazone, cefotaxime, cefoxitin, chloramphenicol, cisatracurium, clindamycin, dobutamine, docetaxel, doxorubicin liposome, doxycycline, enalaprilat, erythromycin lactobionate, esmolol, etoposide, famotidine, fludarabine, gatifloxacin, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, idarubicin, insulin (regular), kanamycin, labetalol, linezolid, meperidine, metronidazole, milrinone, minocycline, morphine, nafcillin, ondansetron, oxacillin, paclitaxel, penicillin G potassium, piperacillin, piperacillin/tazobactam, potassium chloride, propofol, remifentanil, sargramostim, thiotepa, ticarcillin, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vitamin B complex with C. **Incompatible:** Alatrofloxacin, amphotericin B cholesteryl sulfate complex, cefepime. **Variable (consult detailed reference):** Ciprofloxacin.

Compatibility in syringe: Compatible: Metoclopramide. **Incompatible:** Hydrocortisone sodium succinate.

Compatibility when admixed: Compatible: Calcium gluconate, chloramphenicol, cisplatin, heparin, hydrocortisone sodium succinate, isoproterenol, meropenem, methyldopate, norepinephrine, penicillin G potassium, potassium phosphates, verapamil. **Incompatible:** Amphotericin B, clindamycin, cyclosporine, dobutamine, polymyxin B sulfate, procaine, sodium bicarbonate.

ContraindicationsHypersensitivity to any component of the formulation; heart block; myocardial damage

Warnings/Precautions

Disease-related concerns:

- Neuromuscular disease: Use with extreme caution in patients with myasthenia gravis or other neuromuscular disease.
- Renal impairment: Use with caution in patients with renal impairment; accumulation of magnesium may lead to magnesium intoxication.

Special populations:

- Obstetrics: Vigilant monitoring and safe administration techniques (ISMP Medication Safety Alert, 2005) recommended to avoid potential for errors resulting in toxicity. Monitor patient and fetal status, and serum magnesium levels closely.

Dosage form specific issues:

- Aluminum: Solutions may contain aluminum; toxic levels may occur following prolonged administration in premature neonates or patients with renal impairment.

Other warnings/precautions:

- Electrolyte abnormalities: Concurrent hypokalemia or hypocalcemia can accompany a magnesium deficit. Hypomagnesemia is frequently associated with hypokalemia and requires correction in order to normalize potassium.
- Parenteral administration: Monitor serum magnesium level, respiratory rate, blood pressure, deep tendon reflex, and renal function when administered parenterally, particularly with repeated dosing; magnesium toxicity can lead to fatal cardiovascular arrest and/or respiratory paralysis.

Pregnancy Risk FactorA/C (manufacturer dependent)

Pregnancy ConsiderationsMagnesium crosses the placenta; serum levels in the fetus correlate with those in the mother. Magnesium sulfate is used during pregnancy for the treatment of eclampsia and severe pre-eclampsia.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsMagnesium is found in breast milk. The amount is not influenced by dietary intake under normal conditions. In women receiving parenteral magnesium sulfate for the treatment of eclampsia, magnesium levels in breast milk returned to normal 24 hours following discontinuation of treatment.

Adverse ReactionsAdverse effects on neuromuscular function may occur at lower levels in patients with neuromuscular disease (eg, myasthenia gravis).

Frequency not defined:

Cardiovascular: Flushing (I.V.; dose related), hypotension (I.V.; rate related), vasodilation (I.V.; rate related)

Gastrointestinal: Diarrhea

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Magnesium Salts may decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcitriol: May increase the serum concentration of Magnesium Salts. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Eltrombopag: Magnesium Salts may decrease the serum concentration of Eltrombopag. Management: Separate administration of eltrombopag and any polyvalent cation (e.g., magnesium-containing products) by at least 4 hours. *Risk D: Consider therapy modification*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Magnesium may enhance the CNS depressant effect of alcohol (ethyl).

Monitoring Parameters

I.V.: Rapid administration: ECG monitoring, vital signs, deep tendon reflexes; magnesium, calcium, and potassium levels; renal function during administration

Obstetrics: Patient status including vital signs, oxygen saturation, deep tendon reflexes, level of consciousness, fetal heart rate, maternal uterine activity.

Reference RangeSerum magnesium: 1.5-2.5 mg/dL; slightly different ranges are reported by different laboratories

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess results of laboratory tests, therapeutic effect, and adverse/toxic effects. Assess knowledge/teach patient proper use, appropriate interventions to reduce side effects, and adverse symptoms to report.

When administered parenterally, monitor serum magnesium level, respiratory rate, deep tendon reflex, and renal function.

Monitoring: Lab TestsI.V.: Rapid administration: ECG monitoring, vital signs, deep tendon reflexes; magnesium, calcium, and potassium levels; renal function during administration

Patient EducationTake in divided doses. Report diarrhea (>5 stools/day) or changes in mental function to prescriber.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed in D_5W]: 10 mg/mL (100 mL); 20 mg/mL (500 mL)

Infusion [premixed in water for injection]: 40 mg/mL (100 mL, 500 mL, 1000 mL); 80 mg/mL (50 mL)

Injection, solution: 500 mg/mL (2 mL, 10 mL, 20 mL, 50 mL)

Powder, oral/topical: Magnesium sulfate USP (227 g, 454 g, 480 g, 1810 g, 1920 g, 2720 g)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Magnesium Sulfate)

50% (50): $22.99

Mechanism of ActionWhen taken orally, magnesium promotes bowel evacuation by causing osmotic retention of fluid which distends the colon with increased peristaltic activity; parenterally, magnesium decreases acetylcholine in motor nerve terminals and acts on myocardium by slowing rate of S-A node impulse formation and prolonging conduction time. Magnesium is necessary for the movement of calcium, sodium, and potassium in and out of cells, as well as stabilizing excitable membranes.

Pharmacodynamics/Kinetics

Onset of action: Anticonvulsant: I.M.: 1 hour; I.V.: Immediate

Duration of anticonvulsant activity: I.M.: 3-4 hours; I.V.: 30 minutes

Distribution: Bone (50% to 60%); extracellular fluid (1% to 2%)

Protein binding: 30%, to albumin

Excretion: Urine (as magnesium)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Magnesium products may prevent GI absorption of tetracyclines by forming a large ionized chelated molecule with the tetracyclines in the stomach. Tetracyclines should be given at least 1 hour before magnesium.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation or CNS depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive CNS depression

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: Hypomagnesemia can hinder the replenishment of intracellular potassium and should be corrected in order to correct hypokalemia.

Index Terms Epsom Salts; $MgSO_4$ (error-prone abbreviation)

Malathion

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(mal a THYE on)
U.S. Brand NamesOvide®
Pharmacologic Category[Antiparasitic Agent, Topical]; [Pediculocide]; [Scabicidal Agent]
Use: Labeled IndicationsTreatment of head lice and their ova
Dosing: AdultsHead lice: Topical: Sprinkle Ovide® lotion on dry hair and rub gently until the scalp is thoroughly moistened; pay special attention to the back of the head and neck. Allow to dry naturally - use no heat and leave uncovered. After 8-12 hours, the hair should be washed with a nonmedicated shampoo; rinse and use a fine-toothed comb to remove dead lice and eggs. If required, repeat with second application in 7-9 days. Further treatment is generally not necessary. Other family members should be evaluated to determine if infested and if so, receive treatment.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing. Use is contraindicated in neonates and infants.
Administration: TopicalRefer to Dosing.
ContraindicationsHypersensitivity to malathion or any component of the formulation; use in neonates and/or infants
Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue use temporarily if skin irritation occurs.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Other warnings/precautions:

- Appropriate use: For topical use only; avoid contact with eyes.
- Flammable: Lotion is flammable; do not expose to open flames; patients should avoid electric heat sources (eg, hair dryers, curling irons).

Pregnancy Risk FactorB
Pregnancy ConsiderationsNo evidence of teratogenicity in animal models. There are no adequate and well-controlled studies in pregnant women. Use (or handle) during pregnancy only if clearly needed.
Adverse ReactionsFrequency not defined.

Dermatologic: Skin/scalp irritation

Ocular: Conjunctivitis (following contact with eyes)

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Lotion: 0.5% (59 mL) [contains isopropyl alcohol 78%]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Lotion (Ovide)

0.5% (59): $118.11

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Pronunciation(mal toe DEK strin)
U.S. Brand NamesMultidex® [OTC]; OraRinse™ [OTC]
Pharmacologic CategoryAnti-inflammatory, Locally Applied
Use: Labeled IndicationsTopical: Treatment of infected or noninfected wounds
Use: DentalOral: Management and relief of pain due to oral lesions (including mucositis/stomatitis), oral ulcers, or irritation; treatment of aphthous ulcers
Dosing: Adults

Management of pain due to oral lesions: Oral: OraRinse™: 1 tablespoonful, swish or gargle for ~1 minute, 4 times/day or more if needed

Wound dressing: Topical: Multidex®: After debridement and irrigation of wound, apply and cover with a nonadherent, nonocclusive dressing. May be applied to moist or dry, infected or noninfected wounds.

Dosing: ElderlyRefer to adult dosing.
ReconstitutionOraRinse™: Fill bottle with water to first arrow; shake vigorously until suspended; continue to fill to second arrow; shake well
ContraindicationsHypersensitivity to maltodextrin or any component of the formulation
Warnings/Precautions

Dosage form specific issues:

- Oral: Avoid eating or drinking for 1 hour; products are not harmful if accidentally swallowed; notify healthcare provider if improvement is not seen within 7 days

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel, topical dressing:

Multidex®: (4 mL, 7 mL, 14 mL, 85 mL)

Powder, for oral suspension:

OraRinse™: (19 g) [contains phenylalanine; also contains aloe vera, fructose, and sodium benzoate; vanilla flavor]

Powder, topical dressing:

Multidex®: (6 g, 12 g, 25 g, 45 g)

Generic AvailableNo
Mechanism of ActionForms a protective barrier over wound providing an environment which promotes tissue growth.
Dental Health Professional ConsiderationsOraRinse™: Fill bottle with water to first arrow; shake vigorously until suspended; continue to fill to second arrow; shake well
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Manganese

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Manganese sulfate may be confused with magnesium sulfate

Pronunciation(MAN ga nees)
U.S. Brand NamesMangimin [OTC]
Pharmacologic Category[Trace Element, Parenteral]
Use: Labeled IndicationsTrace element added to total parenteral nutrition (TPN) solution to prevent manganese deficiency; orally as a dietary supplement
Dosing: Adults

Adequate intake: Oral:

Male: 1.9-2.3 mg/day

Female: 1.6-1.8 mg/day

Pregnancy: 2 mg/day

Lactation: 2.6 mg/day

Deficiency prevention: I.V.: 150-800 mcg/day usually administered in TPN solutions

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Adequate intake: Oral:

0-6 months: 0.003 mg/day

7-12 months: 0.6 mg/day

1-3 years: 1.2 mg/day

4-8 years: 1.5 mg/day

≥9 years: Refer to adult dosing.

Deficiency prevention: I.V.: Children: 2-10 mcg/kg/day usually administered in TPN solutions

Note: Use caution in premature neonates; manganese chloride solution for injection contains aluminum.

Dosing: Renal ImpairmentUse caution; manganese chloride solution for injection contains aluminum.
Dosing: Hepatic ImpairmentUse caution; dose may need to be decreased or withheld.
Administration: I.V.Solution for injection: Do not administer I.M. or by direct I.V. injection; acidic pH of the solution may cause tissue irritations and it is hypotonic
StorageSolution for injection: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F). Compatible with electrolytes usually present in amino acid/dextrose solution used for TPN solutions.
ContraindicationsHigh manganese levels; severe liver dysfunction or cholestasis (conjugated bilirubin >2 mg/dL) due to reduced biliary excretion
Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Dosage form specific issues:

- Aluminum: Manganese chloride solution for injection contains aluminum; use caution with impaired renal function and in premature infants.

Pregnancy Risk FactorC
LactationEnters breast milk/compatible
Breast-Feeding ConsiderationsNormal concentrations of manganese found in human milk are generally lower than cow's milk or those found in food sources.

Drug Interactions There are no known significant interactions.

Monitoring Parameters Periodic manganese plasma level

Reference Range Plasma: 0.6-2 ng/mL

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as chloride [preservative free]: 0.1 mg/mL (10 mL) [contains aluminum ≤100 mcg/mL]

Injection, solution, as sulfate: 0.1 mg/mL (10 mL)

Tablet, as aspartate: 93 mg [equivalent to elemental manganese 25 mg]

Tablet, as gluconate: 5.7 mg [as elemental manganese]; 550 mg [equivalent to elemental manganese 30 mg]; 600 mg [equivalent to elemental manganese 50 mg]

Tablet, chelated: 50 mg [as elemental manganese]

Mangimin: 10 mg [as elemental manganese]

Generic Available Yes

Mechanism of Action Cofactor in many enzyme systems, stimulates synthesis of cholesterol and fatty acids in liver, and influences mucopolysaccharide synthesis

Pharmacodynamics/Kinetics

Absorption: Oral: Poor (3% to 4%)

Distribution: Concentrated in mitochondria of pituitary gland, pancreas, liver, kidney, and bone

Excretion: Bile (primarily); urine (negligible)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Chronic poisoning may present with extrapyramidal symptoms

Index Terms Manganese Chloride; Manganese Sulfate

Mannitol

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Osmitrol® may be confused with esmolol

Pronunciation(MAN i tole)
U.S. Brand NamesOsmitrol®; Resectisol®
Canadian Brand NamesOsmitrol®
Pharmacologic CategoryDiuretic, Osmotic; Genitourinary Irrigant
Use: Labeled IndicationsReduction of increased intracranial pressure associated with cerebral edema; promotion of diuresis in the prevention and/or treatment of oliguria or anuria due to acute renal failure; reduction of increased intraocular pressure; promoting urinary excretion of toxic substances; genitourinary irrigant in transurethral prostatic resection or other transurethral surgical procedures
Dosing: Adults

Test dose (to assess adequate renal function): I.V.: 12.5 g (200 mg/kg) over 3-5 minutes to produce a urine flow of at least 30-50 mL of urine per hour. If urine flow does not increase, a second test dose may be given. If test dose does not produce an acceptable urine output, then need to reassess management.

Edema (osmotic diuretic): Initial: 0.5-1 g/kg; Maintenance: 0.25-0.5 g/kg every 4-6 hours; usual daily dose: 20-200 g/24 hours

Intracranial pressure/Cerebral edema: I.V.: 0.25-1.5 g/kg/dose I.V. as a 15% to 20% solution over ≥30 minutes; maintain serum osmolality 310 to <320 mOsm/kg.

Prevention of acute renal failure (oliguria): 50-100 g dose

Reduction of intraocular pressure: 1.5-2 g/kg as a 15% to 20% solution; administer over 30 minutes

Treatment of oliguria: 100 g dose

Preoperative for neurosurgery: I.V.: 1.5-2 g/kg administered 1-1.5 hours prior to surgery.

Transurethral: Irrigation: Use urogenital solution as required for irrigation.

Dosing: ElderlyRefer to adult dosing. Consider initiation at lower end of dosing range.
Dosing: Pediatric

Test dose (to assess adequate renal function): I.V.: Children: 200 mg/kg over 3-5 minutes to produce a urine flow of at least 1 mL/kg for 1-3 hours

Edema (osmotic diuretic): I.V.: Children: Initial: 0.25-1 g/kg; Maintenance: 0.25-0.5 g/kg given every 4-6 hours

Dosing: Renal Impairment

Contraindicated in severe renal impairment. If test dose does not produce adequate urine output reassess options. Use caution in patients with underlying renal disease.

Dosing: Hepatic Impairment

No adjustment required.

Administration: I.V.Vesicant. Do not administer with blood. Crenation and agglutination of red blood cells may occur if administered with whole blood. Inspect for crystals prior to administration. If crystals present redissolve by warming solution. Use filter-type administration set.
Administration: I.V. DetailAvoid extravasation.

pH: 4.5-7

StorageShould be stored at room temperature (15°C to 30°C); do not freeze. Crystallization may occur at low temperatures; do not use solutions that contain crystals. Heating in a hot water bath and vigorous shaking may be utilized for resolubilization. Cool solutions to body temperature before using.
Compatibility

Y-site administration: Compatible: Allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, cisatracurium, cladribine, docetaxel, etoposide, fludarabine, fluorouracil, gatifloxacin, gemcitabine, idarubicin, linezolid, melphalan, ondansetron, paclitaxel, piperacillin/tazobactam, propofol, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine. **Incompatible:** Cefepime, doxorubicin liposome, filgrastim.

Compatibility when admixed: Compatible: Amikacin, bretylium, cefamandole, cefoxitin, cimetidine, cisplatin, dopamine, fosphenytoin, furosemide, gentamicin, metoclopramide, nizatidine, ofloxacin, ondansetron, sodium bicarbonate, tobramycin, verapamil. **Incompatible:** Imipenem/cilastatin, meropenem. **Variable (consult detailed reference):** Etoposide with cisplatin and potassium chloride, potassium chloride.

Contraindications

Hypersensitivity to mannitol or any component or the formulation; severe renal disease (anuria); severe dehydration; active intracranial bleeding except during craniotomy; progressive heart failure, pulmonary congestion, or renal dysfunction after mannitol administration; severe pulmonary edema or congestion

Allergy Considerations

- Mannitol Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Fluid/electrolyte loss: Excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation are required. Watch for and correct electrolyte disturbances; adjust dose to avoid dehydration.

- Nephrotoxicity: May cause renal dysfunction especially with high doses; use caution in patients taking other nephrotoxic agents, with sepsis or pre-existing renal disease. To minimize adverse renal effects, adjust to keep serum osmolality less than 320 mOsm/L. Discontinue if evidence of acute tubular necrosis.

Disease-related concerns:

- Cerebral edema: In patients being treated for cerebral edema, mannitol may accumulate in the brain (causing rebound increases in intracranial pressure) if circulating for long periods of time as with continuous infusion; intermittent boluses preferred. Cardiovascular status should also be evaluated; do not administer electrolyte-free mannitol solutions with blood. If hypotension occurs monitor cerebral perfusion pressure to insure adequate.

Other warnings/precautions:

- Adequate renal function: Should not be administered until adequacy of renal function and urine flow is established; use 1-2 test doses to assess renal response.

Pregnancy Risk Factor

C

Pregnancy Considerations

Reproduction studies have not been conducted.

Lactation

Excretion in breast milk unknown/use caution

Adverse Reactions

Frequency not defined.

Cardiovascular: Chest pain, CHF, circulatory overload, hyper-/hypotension, tachycardia

Central nervous system: Chills, convulsions, dizziness, headache

Dermatologic: Rash, urticaria

Endocrine & metabolic: Fluid and electrolyte imbalance, dehydration and hypovolemia secondary to rapid diuresis, hyperglycemia, hypernatremia, hyponatremia (dilutional), hyperosmolality-induced hyperkalemia, metabolic acidosis (dilutional), osmolar gap increased, water intoxication

Gastrointestinal: Nausea, vomiting, xerostomia

Genitourinary: Dysuria, polyuria

Local: Pain, thrombophlebitis, tissue necrosis

Ocular: Blurred vision

Renal: Acute renal failure, acute tubular necrosis (>200 g/day; serum osmolality >320 mOsm/L)

Respiratory: Pulmonary edema, rhinitis

Miscellaneous: Allergic reactions

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersRenal function, daily fluid I & O, serum electrolytes, serum and urine osmolality; for treatment of elevated intracranial pressure, maintain serum osmolality 310 to <320 mOsm/kg.

Nursing: Physical Assessment/MonitoringAssess for adequate renal function and urine flow prior to administration. Lithium toxicity is increased with concurrent use, and concurrent use of other nephrotic agents may increase potential for renal dysfunction. Infusion site must be closely monitored for extravasation; this is a vesicant. Renal and cardiovascular status should be monitored during infusion. Assess results of laboratory tests, therapeutic effectiveness (according to purpose for use), and adverse response (eg, circulatory overload, CHF, rash, water intoxication). Patient teaching should be appropriate to patient condition.

Monitoring: Lab TestsRenal function, serum electrolytes, serum and urine osmolality. For treatment of elevated intracranial pressure, maintain serum osmolality 310-320 mOsm/kg.

Patient EducationReport immediately any muscle weakness, numbness, tingling, acute headache, nausea, dizziness, blurred vision, eye pain, respiratory difficulty, chest pain, or pain at infusion site. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 5% [50 mg/mL] (1000 mL); 10% [100 mg/mL] (500 mL, 1000 mL); 15% [150 mg/mL] (500 mL); 20% [200 mg/mL] (150 mL, 250 mL, 500 mL); 25% [250 mg/mL] (50 mL)

Osmitrol®: 5% [50 mg/mL] (1000 mL); 10% [100 mg/mL] (500 mL, 1000 mL); 15% [150 mg/mL] (500 mL); 20% [200 mg/mL] (250 mL, 500 mL)

Solution, urogenital (Resectisol®): 5% [50 mg/mL] (2000 mL, 4000 mL)

Generic AvailableYes

Mechanism of ActionIncreases the osmotic pressure of glomerular filtrate, which inhibits tubular reabsorption of water and electrolytes and increases urinary output

Pharmacodynamics/Kinetics

Onset of action: Diuresis: Injection: 1-3 hours; Reduction in intracranial pressure: ~15-30 minutes

Duration: Reduction in intracranial pressure: 1.5-6 hours

Distribution: Remains confined to extracellular space (except in extreme concentrations); does not penetrate the blood-brain barrier (generally, penetration is low)

Metabolism: Minimally hepatic to glycogen

Half-life elimination: 1.1-1.6 hours

Excretion: Primarily urine (as unchanged drug)

Related Information

- Management of Drug Extravasations

Pharmacotherapy PearlsMay autoclave or heat to redissolve crystals; mannitol 20% has an approximate osmolarity of 1100 mOsm/L and mannitol 25% has an approximate osmolarity of 1375 mOsm/L

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentHas been used to treat lithium toxicity/overdose but its overall effect in lowering serum lithium level is minimum; if toxicity is severe, hemodialysis is the treatment of choice

Anesthesia and Critical Care Concerns/Other Considerations

Management of Intracerebral Hemorrhage (ICH): Rapid identification of patients experiencing ICH is essential and should be considered a medical emergency due to the progressive deterioration, severe clinical deficits, and high mortality and morbidity. Treatment for ICH has evolved rapidly in recent years. According to the 2007 ACC/AHA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage in Adults, patients with ICH should be treated in a balanced and graded approach with therapies that reduce intracranial pressure (ICP) (eg, mannitol, hypertonic saline solutions, barbiturate coma, head of bed elevation) (Class IIa recommendation). Direct monitoring of ICP and central perfusion pressure (CPP) may be necessary if patient is treated more aggressively. Treatment of ICH with recombinant factor VIIa (rFVIIa) within the first 3-4 hours after onset to slow progression of bleeding has shown promise; however, at this time it cannot be routinely recommended in all patients experiencing ICH (Class IIb recommendation).

Blood pressure (BP) management in patients who are hypertensive is also of paramount importance in treating ICH. The primary rationale for lowering BP is to prevent further progression of the bleed. This can be accomplished using a number of different pharmacologic treatments (eg, nicardipine, labetalol, nitroprusside). Nitroprusside may increase ICP due to the pronounced vasodilatory actions and as a result may be less preferable. Specific BP targets are not supported by available evidence. The 2007 ACC/AHA Guidelines recommend initiating antihypertensive therapy if the SBP >180 mm Hg or if MAP is > 130 mm Hg.

Other information:

May autoclave or heat mannitol solution to redissolve crystals.

Mannitol 20% has an approximate osmolarity of 1100 mOsm/L.

Mannitol 25% has an approximate osmolarity of 1375 mOsm/L.

Index Terms*D*-Mannitol

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ludiomil may be confused with Lamictal®, lamotrigine, Lomotil®

Pronunciation(ma PROE ti leen)

Canadian Brand NamesNovo-Maprotiline

Pharmacologic CategoryAntidepressant, Tetracyclic

Use: Labeled IndicationsTreatment of depression and anxiety associated with depression

Use: Unlabeled/InvestigationalBulimia; duodenal ulcers; enuresis; urinary symptoms of multiple sclerosis; pain; panic attacks; tension headache; cocaine withdrawal

Dosing: AdultsDepression/anxiety: Oral: 75 mg/day to start, increase by 25 mg every 2 weeks up to 150-225 mg/day; given in 3 divided doses or in a single daily dose

Dosing: ElderlyInitial: 25 mg at bedtime, increase by 25 mg every 3 days for inpatients and weekly for outpatients if tolerated. Usual maintenance dose: 50-75 mg/day, higher doses may be necessary in nonresponders.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to maprotiline or any component of the formulation; use of MAO inhibitors within 14 days; use in a patient during the acute recovery phase of MI

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Maprotiline is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Maprotiline is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is moderate relative to other antidepressants.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is moderate relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is high relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with this agent is moderate relative to other antidepressants.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsUse with caution due to sedation and anticholinergic effects (eg, confusion, constipation, difficulty urinating, dry mouth).
Pregnancy Risk FactorB
Adverse Reactions

>10%:

Central nervous system: Drowsiness

Gastrointestinal: Xerostomia

1% to 10%:

Central nervous system: Anxiety, agitation, dizziness, fatigue, headache, insomnia, nervousness

Gastrointestinal: Constipation, nausea

Neuromuscular & skeletal: Tremor, weakness

Ocular: Blurred vision

<1%: Abdominal cramps, accommodation disturbances, akathisia, arrhythmia, ataxia, bitter taste, breast enlargement, confusion, decreased libido, delusions, diaphoresis (excessive), diarrhea, disorientation, dysarthria, dysphagia, edema of testicles, epigastric distress, EPS, exacerbation of psychosis, hallucinations, heart block, hyperglycemia, hyper-/hypotension, hypomania, impotence, mania, motor hyperactivity, mydriasis, nightmares, numbness, palpitation, petechiae, photosensitivity, rash, restlessness, seizure, syncope, tachycardia, tingling, tinnitus, urinary retention, vomiting, weight gain/loss

Metabolism/Transport Effects**Substrate** of CYP2D6 (major)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

MAO Inhibitors: Maprotiline may enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersMonitor blood pressure and pulse rate prior to and during initial therapy; evaluate mood and somatic complaints, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased); monitor appetite and weight; ECG in older adults

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 25 mg, 50 mg, 75 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Maprotiline HCl)

25 mg (60): $33.99

50 mg (60): $39.99

75 mg (60): $55.99

Mechanism of ActionTraditionally believed to increase the synaptic concentration of norepinephrine in the central nervous system by inhibition of their reuptake by the presynaptic neuronal membrane. However, additional receptor effects have been found including desensitization of adenyl cyclase, down regulation of beta-adrenergic receptors, and down regulation of serotonin receptors.

Pharmacodynamics/Kinetics

Absorption: Slow

Protein binding: 88%

Metabolism: Hepatic to active and inactive compounds

Half-life elimination, serum: 27-58 hours (mean: 43 hours)

Time to peak, serum: Within 12 hours

Excretion: Urine (70%); feces (30%)

Related Information

- Antidepressant Agents
- Antidepressant Receptor Profile

Pharmacotherapy PearlsOdorless, bitter tasting; seizures are rarely seen 5-30 hours postdrug ingestion.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough maprotiline is not a tricyclic antidepressant, it does block norepinephrine reuptake within CNS synapses as part of its mechanisms. It has been suggested that vasoconstrictor be administered with caution and to monitor vital signs in dental patients taking antidepressants that affect norepinephrine in this way, including maprotiline. Epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs. Maprotiline is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(mah RAV er rock)

U.S. Brand NamesSelzentry™

Canadian Brand NamesCelsentri™

Pharmacologic CategoryAntiretroviral Agent, CCR5 Antagonist

Use: Labeled IndicationsTreatment of CCR5-tropic HIV-1 infection, in combination with other antiretroviral agents in treatment-experienced patients with evidence of viral replication and HIV-1 strains resistant to multiple antiretroviral therapy

Dosing: AdultsHIV treatment: Oral: 300 mg twice daily

Dosage adjustment for concomitant CYP3A inhibitors/inducers:

CYP3A inhibitors (with or without a CYP3A inducer): 150 mg twice daily; dose recommended when maraviroc administered concomitantly with strong CYP3A inhibitors including (but not limited to) protease inhibitors (excluding tipranavir/ritonavir), delavirdine, ketoconazole, itraconazole, clarithromycin, nefazodone, and telithromycin.

CYP3A inducers (without a strong CYP3A inhibitor): 600 mg twice daily; dose recommended when maraviroc administered concomitantly with CYP3A inducers including (but not limited to) efavirenz, rifampin, carbamazepine, phenobarbital, and phenytoin

Dosing: PediatricHIV treatment: Oral: Adolescents ≥16 years: Refer to adult dosing.

Dosing: Renal ImpairmentNot studied in renal dysfunction; maraviroc levels may be increased.

Cl_{cr} <50 mL/minute (with concomitant CYP3A inhibitor): Not recommended; if no appropriate alternative exists, monitor for increased maraviroc adverse effects

Dosing: Hepatic ImpairmentUse caution; not adequately studied in hepatic dysfunction.

Administration: OralAdminister without regards to meals.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide is available at http://www.selzentry.com/content/SELZENTRY_MedicationGuide.pdf; distribute to each patient to whom this medication is dispensed.

ContraindicationsThere are no contraindications listed within the manufacturer’s labeling.

Warnings/Precautions

Boxed warnings:

- Hepatotoxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Hepatotoxicity: **[U.S. Boxed Warning]: Possible drug-induced hepatotoxicity with allergic type features has been reported;** hepatotoxicity may be preceded by allergic type reactions (eg, pruritic rash, eosinophilia or increased IgE) and/or hepatic adverse events (transaminase increases or signs/symptoms of hepatitis). Consider discontinuation in any patient with possible hepatitis or with elevated transaminases combined with systemic allergic events.

- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.

- Infections: Monitor closely for signs/symptoms of developing infections; associated with a small increase of certain upper respiratory tract infections and herpes virus infections during clinical trials.

- Postural hypotension: Symptomatic postural hypotension has occurred; use caution in patients at risk for postural hypotension due to concomitant medication or history of condition.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease or cardiac risk factors. During trials, a small increase in cardiovascular events (myocardial ischemia and/or infarction) occurred in treated patients compared to placebo, although a contributory relationship relative to therapy is unknown. Of note, patients experiencing events generally had cardiac disease/risk factors prior to therapy.

- Hepatic impairment: Safety and efficacy has not been adequately studied in patients with hepatic impairment; use caution in patients with hepatic dysfunction or concomitant viral hepatitis B or C.

- Renal impairment: Safety and efficacy not adequately studied in renal impairment; renal impairment may increase maraviroc concentrations. Concomitant therapy with CYP3A inhibitors in presence of renal impairment is expected to further increase levels and may lead to increased adverse events; therefore, avoid maraviroc in patients on concomitant CYP3A inhibitors with Cl_{cr} <50 mL/minute unless potential benefits outweighs potential risk.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4/P-glycoprotein inhibitors and moderate or strong CYP3A4/P-glycoprotein inducers (see Drug Interactions); may require dosage adjustments.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Other warnings/precautions:

- Appropriate use: Prior to therapy, tropism testing should be performed for presence of CCR5-tropic HIV-1 infection. Therapy not recommended for use in patients with CXCR4- or dual/mixed tropic HIV-1 infection; efficacy not demonstrated in this population. Safety and efficacy not established in treatment naive patients.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse fetal effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women and available data is insufficient to recommend use in pregnancy. An antiretroviral registry has been established to monitor maternal and fetal outcomes in women receiving antiretroviral drugs. Physicians are encouraged to register patients at 1-800-258-4263 or www.APRegistry.com.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions

>10%:

Central nervous system: Fever (13%)

Respiratory: Upper respiratory tract infection (23%), cough (14%)

2% to 10%:

Cardiovascular: Vascular hypertensive disorder (3%)

Central nervous system: Dizziness (9%), insomnia (8%), anxiety (4%), consciousness disturbances (4%), depression (4%), pain (4%)

Dermatologic: Rash (11%), pruritus (4%), folliculitis (3%), skin neoplasms (benign; 3%), erythema (2%)

Endocrine & metabolic: Lipodystrophy (3%)

Gastrointestinal: Appetite disorders (8%), constipation (6%)

Genitourinary: Urinary tract/bladder symptoms (3% to 5%), genital warts (2%)

Hematologic: Neutropenia (grades 3/4: 4%)

Hepatic: Transaminases increased (grades 3/4: 2% to 5%), bilirubin increased (grades 3/4: 6%)

Neuromuscular & skeletal: Joint disorders (7%), paresthesia (5%), peripheral neuropathy (4%), sensory abnormality (4%), muscle pain (3%)

Ocular: Conjunctivitis (2%), infection/inflammation (2%)

Otic: Otitis media (2%)

Respiratory: Bronchitis (7%), sinusitis (7%), respiratory tract/sinus disorder (3% to 6%), breathing abnormality (4%)

Miscellaneous: Herpes infection (8%), sweat gland disturbances (5%), influenza (2%)

<2%, postmarketing, and/or case reports: Acute cardiac failure, anal cancer, angina, basal cell carcinoma, bile duct neoplasm, bone marrow depression, cerebrovascular accident, cholestatic jaundice, coronary artery disease, coronary artery occlusion, creatine kinase increased, endocarditis, endocrine neoplasm, esophageal carcinoma, hepatic cirrhosis, hepatic failure, hepatotoxicity, hypoplastic anemia, liver metastases, lymphoma, MI, myocardial ischemia, myositis, osteonecrosis, pneumonia, portal vein thrombosis, rhabdomyolysis, seizure, septic shock, squamous cell carcinoma, syncope, T-cell lymphoma, tongue neoplasm, tremor, viral meningitis

Metabolism/Transport Effects**Substrate** of CYP3A4 (major), P-glycoprotein

Drug Interactions

CYP3A4 Inducers: May decrease the serum concentration of Maraviroc. **Exceptions:** Ritonavir. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors: May increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Lopinavir: May increase the serum concentration of Maraviroc. Management: Reduce maraviroc dose to 150mg twice daily when maraviroc is used concurrently with lopinavir/ritonavir. *Risk D: Consider therapy modification*

St Johns Wort: May decrease the serum concentration of Maraviroc. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: St. John’s wort may decrease maraviroc concentrations leading to loss of therapeutic efficacy and potentially increased risk of resistance; concomitant use not recommended.

Monitoring ParametersViral load, CD4 count, transaminases; signs/symptoms of infection, hepatitis and/or allergic reaction; postural hypotension; tropism testing (prior to initiation)

Nursing: Physical Assessment/MonitoringUse caution in presence of hepatic impairment, cardiovascular disease, or cardiac risk factors. Assess all other pharmacological or herbal products patient may be taking for potential interactions or toxicity; dosing adjustments may be necessary. An FDA-approved medication guide is available with prescription and patients should be cautioned to read this information. Evaluate results of laboratory tests and effectiveness of therapy (viral load, CD4 count, transaminase levels) and adverse reactions (hepatotoxicity, upper respiratory infections, hyper- or hypotension, CNS changes, gastrointestinal upset) periodically during therapy. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions, and adverse symptoms to report (eg, rash, gastrointestinal upset).

Monitoring: Lab TestsViral load, CD4 count, transaminases; tropism testing (prior to initiation)

Patient EducationYou will be provided with a medication guide with each prescription that includes a list of specific medications that should not be used during therapy; do not take any new prescription or OTC medications or herbal products during therapy (even if they are not on the list) without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. May be taken with or without food; do not break or chew tablets; swallow whole. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. You may be susceptible to infection (avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber). Frequent blood tests may be required with prolonged therapy. May cause nausea, vomiting, or stomach pain (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); dizziness, insomnia, or consciousness disturbances (use caution when driving or engaging in hazardous tasks until response to drug is known); constipation (increased fluids and exercise may help); postural hypotension (use caution when changing position from lying or sitting to standing or when climbing stairs); or muscle or joint pain (consult prescriber for analgesic). Report skin rash or irritation; persistent muscle pain, headache, fatigue, or gastrointestinal upset; unusual cough, fever, or cold symptoms; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Selzentry™: 150 mg, 300 mg

Generic AvailableNo

ManufacturerPfizer, Inc

Mechanism of ActionMaraviroc, a CCR5 antagonist, selectively and reversibly binds to the chemokine (C-C motif receptor 5 [CCR5]) coreceptors located on human CD4 cells. CCR5 antagonism prevents interaction between the human CCR5 coreceptor and the gp120 subunit of the viral envelope glycoprotein, thereby inhibiting gp120 conformational change required for CCR5-tropic HIV-1 fusion with the CD4 cell and subsequent cell entry.

Pharmacodynamics/Kinetics

Distribution: V_d: ~194 L

Protein binding: ~76%

Metabolism: Hepatic, via CYP3A to inactive metabolites

Bioavailability: 23% to 33%

Half-life elimination: 14-18 hours

Time to peak, plasma: 0.5-4 hours

Excretion: Urine (~20%, 8% as unchanged drug); feces (76%, 25% as unchanged drug)

Related Information

- Perinatal HIV Guidelines

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis has been observed.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentMay produce postural hypotension; concomitant use with psychotropic agents may produce additive effects. May cause neutropenia; use caution with clozapine and carbamazepine. High potential for drug-drug interactions. Carbamazepine, phenobarbital, and phenytoin may decrease the levels/effects of maraviroc; dosage adjustment of maraviroc may be recommended. Nefazodone may increase the levels/effects of maraviroc; dosage adjustment of maraviroc may be recommended. St John's wort may decrease levels of maraviroc and lead to possible resistance; concurrent use is not recommended.

Measles Virus Vaccine (Live)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Attenuvax® may be confused with Meruvax®

Pronunciation(MEE zels VYE rus vak SEEN, live)

U.S. Brand NamesAttenuvax®

Pharmacologic CategoryVaccine, Live (Viral)

Use: Labeled IndicationsActive immunization against measles (rubeola)

Note: Trivalent measles - mumps - rubella (MMR) is the vaccine of choice if recipients are likely to be susceptible to rubella and/or mumps as well as to measles.

Dosing: AdultsImmunization: SubQ: 0.5 mL in outer aspect of the upper arm. **Note:** Trivalent measles - mumps - rubella (MMR) vaccine should be used unless contraindicated in adults and children ≥12 months of age.

Adults born in or after 1957 without documentation of live vaccine on or after first birthday, without physician-diagnosed measles, or without laboratory evidence of immunity should be vaccinated, ideally with 2 doses of vaccine separated by no less than 1 month. For those previously vaccinated with 1 dose of measles vaccine, revaccination is recommended for students entering colleges and other institutions of higher education, for healthcare workers at the time of employment, and for international travelers who visit endemic areas. Persons vaccinated between 1963 and 1967 with a killed measles vaccine, followed by live vaccine within 3 months, or with a vaccine of unknown type should be revaccinated with live measles virus vaccine.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricImmunization: SubQ: Children ≥6 months: 0.5 mL in outer aspect of the upper arm. **Note:** Trivalent measles - mumps - rubella (MMR) vaccine should be used unless contraindicated in adults and children ≥12 months of age.

Primary vaccination recommended at 12-15 months of age and repeated at 4-6 years of age. Children requiring vaccination with measles virus vaccine prior to 12 months of age (eg, during local outbreak, international travel to endemic area) should receive another dose between 12-15 months and again prior to elementary school.

Administration: OtherVaccine should not be administered I.V.; SubQ injection preferred with a 25-gauge $^5/_8$" needle

StorageDuring shipment, store at ≤10°C (50°F). Prior to and following reconstitution, refrigerate at 2°C to 8°C (36°F to 46°F). Protect from light at all times. Following reconstitution, use within 8 hours.

ContraindicationsHypersensitivity to measles vaccine or any component of the formulation; current febrile illness; patients receiving immunosuppressive therapy (not including steroid replacement); primary and acquired immunodeficiency states; blood dyscrasias, cancers affecting the bone marrow or lymphatic systems; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use. Use extreme caution in patients with immediate-type hypersensitivity reactions to eggs.
- Neomycin sensitivity: Contact dermatitis to neomycin is not a contraindication to the vaccine.

Disease-related concerns:

- Acute illness: The manufacturer contraindicates use with febrile infections; however, the ACIP notes that patients with minor illnesses with or without fever (diarrhea, mild upper respiratory tract infection, otitis media) may receive vaccines.
- CNS disorders: Use with caution in patients with history of cerebral injury, seizures, or other conditions where stress due to fever should be avoided.
- Measles exposure: Exposure to measles is not a contraindication to vaccine; use within 72 hours of exposure may provide some protection.
- Thrombocytopenia: Use with caution in patients with thrombocytopenia and those who develop thrombocytopenia after first dose; thrombocytopenia may worsen.
- Tuberculosis: Therapy to treat tuberculosis should be started prior to administering vaccine to patients with untreated, active tuberculosis.

Concurrent drug therapy issues:

- Immune globulins: Recent administration of immune globulins may interfere with immune response.

Special populations:

- Altered immunocompetence: Use is contraindicated in severely immunocompromised patients (eg, patients receiving chemo-/radiation therapy or other immunosuppressive therapy (including high-dose corticosteroids)); may have a reduced response to vaccination. Patients with HIV infection, who are asymptomatic and not severely immunosuppressed may be vaccinated. Patients with leukemia who are in remission and who have not received chemotherapy for at least 3 months may be vaccinated.

- Healthcare workers: Acceptable evidence of immunity is recommended healthcare workers at time of employment.

- Pediatrics: Safety and efficacy have not been established in children <6 months of age.

- Students: Acceptable evidence of immunity is recommended for students entering institutions of higher learning.

- Travelers to endemic areas: Acceptable evidence of immunity is recommended for travelers to endemic areas.

Dosage form specific issues:

- Albumin: Products may contain albumin.

- Gelatin: Products may contain gelatin.

- Neomycin: Products may contain neomycin.

Other warnings/precautions:

- Blood products: Recent administration of blood or blood products may interfere with immune response.

Geriatric ConsiderationsGenerally not recommended for adults since most have become immune; if from an isolated community where measles is not endemic, may require vaccination; no dose reduction is necessary

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted. Vaccine should not be administered to pregnant women and the ACIP recommends that pregnancy be avoided for 28 days following vaccination. Infection with natural measles during pregnancy may increase the risk of spontaneous abortion, stillbirth, congenital defects and prematurity.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsBreast-feeding is not a contraindication to vaccination.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Frequency not defined.

Cardiovascular: Peripheral edema, syncope, vasculitis

Central nervous system: Ataxia, dizziness, encephalitis, encephalopathy, febrile seizure, fever, Guillain-Barré syndrome, headache, irritability, malaise, seizure

Dermatologic: Angioneurotic edema, erythema multiforme, panniculitis, purpura, rash, Stevens-Johnson syndrome, urticaria

Gastrointestinal: Diarrhea, nausea, vomiting

Hematologic: Leukocytosis, thrombocytopenia

Local: Injection site reactions: Burning, redness, stinging, swelling, vesiculation, wheal and flare

Neuromuscular & skeletal: Arthralgia, myalgia

Ocular: Conjunctivitis, ocular palsies, optic neuritis, papillitis, retinitis, retrobulbar neuritis

Otic: Nerve deafness, otitis media

Respiratory: Bronchial spasm, cough, pneumonitis, rhinitis

Miscellaneous: Anaphylaxis/anaphylactoid reactions, atypical measles, facial edema, lymphadenopathy, measles inclusion body encephalitis, subacute sclerosing pancephalitis

Drug Interactions

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Test InteractionsMay temporarily depress tuberculin skin test sensitivity; tuberculin test may be given simultaneously on the same day as vaccine or ≥4 weeks later.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Attenuvax®: ≥1000 TCID_{50} [contains albumin (human), bovine serum, chicken egg protein, gelatin, neomycin, sorbitol, and sucrose (1.9 mg/vial)]

Generic AvailableNo

Mechanism of ActionPromotes active immunity to measles virus by inducing specific measles IgG and IgM antibodies. Measles antibodies develop in ~95% of children vaccinated at 12 months of age and in 98% of children vaccinated at 15 months of age. Life-long immunity is induced in most persons completing vaccination schedule.

Related Information

- Immunization Recommendations
- Prophylaxis for Patients Exposed to Common Communicable Diseases

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Acceptable presumptive evidence of immunity includes one of the following:

1. Documentation of adequate vaccination. Adequate vaccination is defined as 1 dose of a live mumps virus vaccine for preschool children and adults not at high risk; 2 doses of a live mumps virus vaccine for school-aged children and high-risk adults. Healthcare workers, international travelers, and students in institutions of higher learning are considered high-risk adults.

2. Laboratory evidence of immunity

3. Birth prior to 1957

4. Documentation of physician-diagnosed disease

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

MMR (measles, mumps and rubella virus vaccine) may be confused with MMRV (measles, mumps, rubella, and varicella) vaccine

Pronunciation(MEE zels, mumpz & roo BEL a VYE rus vak SEEN)

U.S. Brand NamesM-M-R® II

Canadian Brand NamesM-M-R® II; Priorix™

Pharmacologic CategoryVaccine, Live (Viral)

Use: Labeled IndicationsMeasles, mumps, and rubella prophylaxis

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for the following:

- All children (first dose given at 12-15 months of age)
- Adults born 1957 or later (without evidence of immunity or documentation of vaccination).
- Adults at higher risk for exposure to and transmission of measles mumps and rubella should receive special consideration for vaccination. This includes international travelers, persons attending colleges and other post-high school education, persons working in healthcare facilities.

Dosing: Adults**Immunization:***Born ≥1957 without evidence of immunity* (also see Additional Information or Pharmacotherapy Pearls): SubQ: 1 or 2 doses (0.5 mL/dose); minimum interval between doses is 28 days

Mumps outbreak:

Healthcare workers born <1957 without other evidence of immunity: Consider 2 doses of a live mumps virus vaccine; minimum interval between doses is 28 days

Low-risk adults: A second dose of a live mumps virus vaccine should be considered in adults who previously received 1 dose; minimum interval between doses is 28 days

Measles outbreak:

Students and personnel in affected schools and healthcare workers born <1957 without evidence of measles immunity: One dose of MMR vaccine

Students and personnel in affected schools and healthcare workers born ≥1957 without adequate documentation of 2 previous doses of a measles-containing vaccine after their first birthday or evidence of measles immunity: Two doses of MMR vaccine; minimum interval between doses is 28 days

Dosing: Pediatric

Immunization: SubQ: *Children ≥12 months:*

Primary immunization: 12-15 months of age: 0.5 mL

Revaccination: 4-6 years of age: 0.5 mL; revaccination is recommended prior to elementary school. If the second dose was not received, the schedule should be completed by the 11- to 12-year old visit.

Measles outbreak: SubQ:

Infants 6-11 months: If there is risk of exposure to measles, single-antigen measles vaccine should be administered. If single-antigen vaccine is not readily available, MMR is an acceptable alternative. Children should be revaccinated at ≥12 months with standard 2-dose series.

Children ≥12 months: Revaccination with MMR is recommended for attendees and siblings of daycare facilities or schools if they cannot provide adequate documentation of 2 previous doses of a measles-containing vaccine after their first birthday or evidence of measles immunity.

Mumps outbreak: SubQ: *Children ≥12 months:* During a mumps outbreak, children ages 1-4 years should consider a second dose of a live mumps virus vaccine; minimum interval between doses is 28 days

Administration: I.V.Not for I.V. administration.

Administration: OtherAdminister SubQ in outer aspect of the upper arm in patients ≥12 months

Administration with other vaccines:

MMR with inactivated vaccines: May be given simultaneously or at any interval between doses

MMR with other live vaccines:

Intranasal or injectable: If not given simultaneously, wait at least 4 weeks between administration

Oral: May be given simultaneously or at any interval between doses of live or inactivated injectable vaccines

Vaccine administration with antibody-containing products*: Do not give MMR simultaneously.

Measles-containing vaccines should be given:

≥3 months following hepatitis A immune globulin, hepatitis B immune globulin, tetanus immune globulin or red blood cells (adenine-saline added)

≥4 months after rabies immune globulin

≥5 months after measles immune globulin prophylaxis in a nonimmunocompromised contact

≥6 months after measles immune globulin in an immunocompromised contact, packed red blood cells (hematocrit 65%), whole blood (hematocrit 35% to 50%), or cytomegalovirus I.V. immune globulin

≥8 months after IVIG replacement therapy for immune deficiencies (excluding children with asymptomatic or mildly symptomatic HIV infection), immune thrombocytopenic purpura (lower dose), or postexposure varicella prophylaxis (see CDC reference for details)

≥10 months after IVIG for the treatment of immune thrombocytopenic purpura (higher dose)

≥11 months after IVIG for the treatment of Kawasaki disease

*Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products

StorageDuring shipment, store at ≤10°C (≤50°F). Prior to reconstitution, store the powder at 2°C to 8°C (36°F to 46°F) or colder (freezing does not affect potency). Protect from light. Diluent may be stored in refrigerator or at room temperature. Do not freeze diluent.

ReconstitutionUse entire contents of the provided diluent to reconstitute vaccine. Gently agitate to mix thoroughly. Discard if powder does not dissolve. Use as soon as possible following reconstitution (may be stored at 2°C to 8°C/36°F to 46°F; protect from light); discard if not used within 8 hours.

ContraindicationsHypersensitivity to measles, mumps, and rubella vaccine or any component of the formulation; current febrile respiratory illness or other febrile infection; patients receiving immunosuppressive therapy; primary and acquired immunodeficiency states; blood dyscrasias, cancers affecting the bone marrow or lymphatic systems; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever). Per the ACIP, may administer to patients with mild acute illness (with or without fever).

- CNS disorders: Use with caution in patients with history of cerebral injury, seizures, or other conditions where stress due to fever should be avoided.

- Measles exposure: Exposure to measles is not a contraindication to vaccine; use within 72 hours of exposure may provide some protection.

- Thrombocytopenia: Use with caution in patients with thrombocytopenia and those who develop thrombocytopenia after first dose; thrombocytopenia may worsen.

- Tuberculosis: Therapy to treat tuberculosis should be started prior to administering vaccine to patients with active tuberculosis. Patients with untreated, active tuberculosis should not receive vaccine.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Altered immunocompetence: Use is contraindicated in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy [including high-dose corticosteroids]); may have a reduced response to vaccination. Patients with HIV infection, who are asymptomatic and not severely immunosuppressed may be vaccinated. Patients with leukemia who are in remission and who have not received chemotherapy for at least 3 months may be vaccinated.

- Pediatrics: Safety and efficacy of measles vaccine has not been established in children <6 months of age and safety and efficacy of mumps and rubella vaccines have not been established in <12 months of age. Local health departments may recommend vaccine to children 6-12 months of age in outbreak situations, but this would not count towards their immunization series.

Dosage form specific issues:

- Eggs allergy: Vaccine contains trace amounts of chick embryo antigen. Use caution in patients with history of immediate hypersensitivity/anaphylactic reactions following egg ingestion.

- Gelatin: Contains gelatin; do not use in patients with a history of anaphylactic/anaphylactoid reaction to gelatin.

- Neomycin sensitivity: Manufactured with neomycin. Patients with history of anaphylaxis should not receive vaccine; contact dermatitis to neomycin is not a contraindication to the vaccine.

Geriatric ConsiderationsMost adults and elderly are immune to measles (rubeola) and it is not necessary to vaccinate. If no history of measles exposure or patient is from an isolated community where measles is not endemic, vaccination may be required. Testing may be indicated; may need to test for rubella. Vaccinate those traveling into endemic areas with no evidence of immunity. No dose restriction necessary.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. It is not known whether the drug can cause fetal harm or affect reproduction capacity (contracting natural measles during pregnancy can increase fetal risk). Do not administer to pregnant females. The Advisory Committee on Immunization Practices (ACIP) recommends that pregnancy should be avoided for 28 days following vaccination.

Lactation

Measles/mumps: Excretion in breast milk unknown/use caution

Rubella: Enters breast milk/use caution

Breast-Feeding ConsiderationsEvidence of rubella infection has occurred in breast-fed infants following maternal immunization, most without severe disease.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Frequency not defined:

Cardiovascular: Syncope, vasculitis

Central nervous system: Ataxia, dizziness, febrile seizure, fever, encephalitis, encephalopathy, Guillain-Barré syndrome, headache, irritability, malaise, measles inclusion body encephalitis, polyneuritis, polyneuropathy, seizure, subacute sclerosing panencephalitis

Dermatologic: Angioneurotic edema, erythema multiforme, measles-like rash, pruritus, purpura, rash, Stevens-Johnson syndrome, urticaria

Endocrine & metabolic: Diabetes mellitus, parotitis

Gastrointestinal: Diarrhea, nausea, pancreatitis, sore throat, vomiting

Genitourinary: Epididymitis, orchitis

Hematologic: Leukocytosis, thrombocytopenia

Local: Injection site reactions which include burning, induration, redness, stinging, swelling, tenderness, wheal and flare, vesiculation

Neuromuscular & skeletal: Arthralgia/arthritis (variable; highest rates in women, 12% to 26% versus children, up to 3%), myalgia, paresthesia

Ocular: Conjunctivitis, ocular palsies, optic neuritis, papillitis, retinitis, retrobulbar neuritis

Otic: Nerve deafness, otitis media

Respiratory: Bronchospasm, cough, pneumonia, pneumonitis, rhinitis

Miscellaneous: Anaphylactoid reactions, anaphylaxis, atypical measles, panniculitis, regional lymphadenopathy

Postmarketing and/or case reports: Aseptic meningitis (associated with Urabe strain of mumps vaccine)

Drug Interactions

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Test InteractionsTemporary suppression of TB skin test reactivity with onset approximately 3 days after administration

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

M-M-R® II: Measles virus ≥1000 TCID$_{50}$, mumps virus ≥20,000 TCID$_{50}$, and , rubella virus ≥1000 TCID$_{50}$ [contains albumin (human), bovine serum, chicken egg protein, gelatin, neomycin, sorbitol, and sucrose 1.9 mg/vial]

Generic AvailableNo

Mechanism of ActionAs a live, attenuated vaccine, MMR vaccine offers active immunity to disease caused by the measles, mumps, and rubella viruses.

Related Information

- Immunization Recommendations

Pharmacotherapy PearlsFederal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Acceptable presumptive evidence of immunity includes one of the following:

1. Documentation of adequate vaccination (for measles, mumps, and rubella). Adequate vaccination for mumps is defined as 1 dose of a live mumps virus vaccine for preschool children and adults not at high risk; 2 doses of a live mumps virus vaccine for school-aged children and high-risk adults. Healthcare workers, international travelers, and students in institutions of higher learning are considered high-risk adults.
2. Laboratory evidence of immunity (for measles, mumps, and rubella)
3. Birth prior to 1957 (measles and mumps); for women of childbearing potential, birth prior to 1957 is not acceptable evidence of immunity to rubella
4. Documentation of physician-diagnosed disease (for measles, mumps, and rubella)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental Status

May cause dizziness, encephalopathy, irritability, and malaise

Mental Health: Effects on Psychiatric Treatment

None reported

Index TermsMMR; Mumps, Measles and Rubella Vaccines, Combined; Rubella, Measles and Mumps Vaccines, Combined

Special Alerts

Measles, Mumps, Rubella, and Varicella (MMRV) Virus Vaccine: ACIP Recommendations Updated - April 2008

Due to reports of an increased risk of febrile seizures associated with the combination MMRV vaccine (ProQuad®), the Advisory Committee on Immunization Practices (ACIP) has altered their opinion on using MMRV combination vaccine preferentially over administration of MMR and varicella as 2 separate vaccines. The new language states “Combination MMRV vaccine is approved for use among healthy children ages 12 months to 12 years. MMRV is indicated for simultaneous vaccination against measles, mumps, rubella, and varicella. ACIP does not express a preference for use of MMRV vaccine over separate injections of equivalent component vaccines (ie, MMR vaccine and varicella vaccine).” Preliminary data from a CDC-sponsored postmarketing study and interim results from a postlicensure study done by Merck have found an increased rate of febrile seizures occurring within 7-10 days after vaccination with MMRV in children 12-23 months of age compared to vaccination with MMR and varicella as separate vaccines. While MMR is also associated with an increased risk of febrile seizures, results suggest that use of the combination product results in 2 times more risk of febrile seizures. A working group will be established to further investigate these findings and will communicate updates as necessary. Merck updated their package insert to include the postmarketing adverse events in February of 2008. MMRV is currently on shortage in the U.S. due to manufacturing issues, the shortage is not expected to resolve before 2009. All clinically significant adverse events following vaccine should be reported to the Vaccine Adverse Event Reporting System (VAERS) (1-800-822-7967).

http://www.cdc.gov/vaccinesafety/vsd/mmrv.htm

VAERS website: http://www.fda.gov/cber/vaers/vaers.htm

Pronunciation(MEE zels, mumpz, roo BEL a, & var i SEL a VYE rus vak SEEN)
U.S. Brand NamesProQuad®
Pharmacologic CategoryVaccine, Live (Viral)
Use: Labeled IndicationsTo provide simultaneous active immunization against measles, mumps, rubella, and varicella
Dosing: PediatricImmunization: Children 12 months to 12 years: SubQ: One dose (0.5 mL)

Administer on or after the first birthday, as soon as child becomes eligible for vaccination. It may be used whenever all components of the vaccine are needed in children within this age group. (Refer to current CDC Recommended Immunization Schedule)

Allow at least 1 month between administering a dose of a measles containing vaccine (eg, M-M-R® II) and ProQuad®.

Allow at least 3 months between administering a varicella containing vaccine (eg, Varivax®) and ProQuad®.

Administration: OtherFor SubQ injection only; inject in the outer aspect of the deltoid region of the upper arm or in the higher anterolateral area of the thigh. Administer immediately following reconstitution.
Storage

Vaccine: During shipment, powder should be stored at or below -15˚C (5°F). Prior to reconstitution, may be stored in a freezer for up to 18 months at temperatures at or below -15˚C (5°F). May store under refrigeration at 2°C to 8˚C (36°F to 46˚F) for up to 72 hours prior to reconstitution. Protect from light at all times. Following reconstitution, use within 30 minutes.

Diluent: Store under refrigeration at 2°C to 8˚C (36°F to 46˚F) or at room temperature of 20°C to 25˚C (68°F to 77˚F).

ReconstitutionUse only diluent provided. Gently agitate to dissolve powder. Use only sterile syringes that are free of preservatives, antiseptics, detergents, or other antiviral substances.
ContraindicationsHypersensitivity to measles, mumps, rubella, and/or varicella vaccines, or any component of the formulation; anaphylactic reaction to neomycin; individuals with blood dyscrasias, leukemia, lymphomas, or other malignant neoplasms affecting the bone marrow or lymphatic systems; those receiving immunosuppressive therapy (including high-dose systemic corticosteroids); primary and acquired immunodeficiency states; family history of congenital or hereditary immunodeficiency; active untreated tuberculosis; current febrile illness with fever >38.5°C (>101.3°F); pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.

- Febrile seizures: Children 12-23 months of age have been reported to have a higher risk of developing febrile seizures with the use of the combination product (MMRV) compared to administration of MMR and varicella separately.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).

- CNS disorders: Use with caution in patients with history of cerebral injury, seizures, or other conditions where stress due to fever should be avoided.

- HIV: Safety and efficacy have not been established in patients with HIV infection.

- Thrombocytopenia: Use with caution in patients with thrombocytopenia and those who develop thrombocytopenia after first dose; thrombocytopenia may worsen.

Concurrent drug therapy issues:

- Salicylates: Avoid use of salicylates for 6 weeks following vaccination; varicella may increase the risk of Reye's syndrome.

Special populations:

- Pediatrics: This combination vaccine is for use in primary immunization of children 12 months to 12 years of age; may also be used if a second dose of measles, mumps, and rubella vaccine is to be administered.

Dosage form specific issues:

- Albumin: Products may contain albumin.

- Egg allergy: Vaccine contains trace amounts of chick embryo antigen. Use caution in patients with history of immediate hypersensitivity/anaphylactic reactions following egg ingestion

- Gelatin: Products may contain gelatin.

- Neomycin sensitivity: Manufactured with neomycin. Patients with history of anaphylaxis should not receive vaccine; contact dermatitis to neomycin is not a contraindication to the vaccine.

Other warnings/precautions:

- Blood products: Recent administration of blood or blood products may interfere with immune response.

- Transmission of virus: Vaccinated individuals should not have close association with susceptible high-risk individuals (newborns of women without positive history of varicella, pregnant women without positive history of varicella, immunocompromised persons) for 6 weeks following vaccination; transmission of varicella virus may occur.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. It is not known whether the vaccine can cause fetal harm or affect reproduction capacity (contracting natural measles during pregnancy can increase fetal risk). Rates of spontaneous abortion may be increased if mumps infection occurs during the first trimester. Although mumps vaccine virus can infect the placenta and fetus, there is not good evidence that it causes congenital malformations. Do not administer to pregnant females and pregnancy should be avoided for 3 months following vaccination. A pregnancy registry has been established for pregnant women exposed to varicella virus vaccine (800-986-8999).

Lactation

Measles, mumps, varicella: Excretion in breast milk unknown/use caution

Rubella: Enters breast milk/use caution

Breast-Feeding Considerations

Following vaccination of the mother, rubella virus may be transmitted to the nursing infant via breast milk.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

Also refer to Measles, Mumps, and Rubella Vaccines (Combined) (M-M-R® II) and Varicella Virus Vaccine (Varivax®) monographs for additional adverse reactions reported with those agents.

>10%:

Central nervous system: Fever ≥38.9˚C (≥102˚F) (22%)

Local: Injection site reaction including pain, tenderness, soreness (22%); erythema (14%)

1% to 10%:

Central nervous system: Irritability (7%)

Dermatologic: Measles-like rash (3%), varicella-like rash (2%), rash (2%), viral exanthema (1%)

Gastrointestinal: Diarrhea (1%)

Local: Injection site reaction: Swelling (8%), bruising (2%)

Respiratory: Upper respiratory tract infection (1%)

<1%: Anorexia, cough, crying, dermatitis, injection site hemorrhage, injection site rash, insomnia, malaise, miliaria ruba, nasal congestion, otitis, otitis media, pharyngitis, respiratory congestion, rhinorrhea, rubella-like rash, sleep disorder, somnolence, viral infection, vomiting

Postmarketing and/or case reports: Anaphylactic reaction, convulsion, encephalitis, febrile seizure (usually occurring 5-12 days after vaccination; highest risk in 12-23 months of age), herpes zoster, pruritus

Drug Interactions

5-ASA Derivatives: May enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. The primary concern is the potential development of Reye's Syndrome, a condition that has been associated with the use of salicylates in children with varicella infections. *Risk D: Consider therapy modification*

Immune Globulins: May diminish the therapeutic effect of Vaccines (Live). *Risk D: Consider therapy modification*

Immunosuppressants: May enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Salicylates: May enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Tuberculin Tests: Vaccines (Live) may diminish the diagnostic effect of Tuberculin Tests. *Risk D: Consider therapy modification*

Test InteractionsMay interfere with sensitivity to tuberculin skin test; administer before, simultaneously with, or at least 4-6 weeks after vaccine.

Monitoring ParametersRash, fever

Nursing: Physical Assessment/MonitoringFor use in children 12 months to 12 years. Assess hypersensitivity history and health status (eg, contraindicated conditions) prior to administration. Epinephrine injection and other appropriate agents and equipment must be immediately available in event of anaphylactic or serious allergic reactions. **Note:** All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS). Record date of administration, name of manufacturer, lot number, and administering person’s name, title and address into patient’s permanent medical record. Teach patient/caregiver possible side effects, appropriate interventions (eg, avoid use of salicylates for 6 weeks following vaccination), and adverse symptoms to report.

Patient EducationChildren who are moderately to severely ill (with or without fever) should not get this vaccination until they have recovered. Inform prescriber of all previous allergic reactions, any health conditions, and any other medications being used. Do not use aspirin or aspirin-containing products for 6 weeks following vaccination. You may experience fever (consult prescriber for antipyretic), mild pain, redness, swelling at injection site, headache, mild gastrointestinal upset, irritability, mild rash, or upper respiratory tract infection. Report immediately any severe reaction at injection site; any chills or fever; persistent diarrhea; severe rash or other adverse reactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

ProQuad®: Measles virus ≥3.00 log$_{10}$ TCID$_{50}$, mumps virus ≥4.3 log$_{10}$ TCID$_{50}$, rubella virus ≥3.00 log$_{10}$ TCID$_{50}$, and varicella virus ≥3.99 log$_{10}$ PFU [contains albumin (human), bovine serum, chicken egg protein, gelatin, neomycin, sorbitol, and sucrose (≤21 mg/vial)]

Generic AvailableNo

ManufacturerMerck and Co, Inc

Mechanism of ActionA live, attenuated virus; offers active immunity to disease caused by the measles, mumps, rubella, and varicella-zoster virus.

Jump To Field (Select Field Name)

Pronunciation(me BEN da zole)
U.S. Brand NamesVermox® [DSC]
Canadian Brand NamesVermox®
Pharmacologic Category[Anthelmintic]
Use: Labeled IndicationsTreatment of pinworms (*Enterobius vermicularis*), whipworms (*Trichuris trichiura*), roundworms (*Ascaris lumbricoides*), and hookworms (*Ancylostoma duodenale*)
Dosing: Adults

Pinworms: Oral: 100 mg as a single dose; may need to repeat after 2 weeks; treatment should include family members in close contact with patient.

Whipworms, roundworms, hookworms: Oral: 1 tablet twice daily, morning and evening on 3 consecutive days; if patient is not cured within 3-4 weeks, a second course of treatment may be administered.

Capillariasis: Oral: 200 mg twice daily for 20 days

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren ≥2 years: Refer to adult dosing.
Dosing: Renal ImpairmentNot dialyzable (0% to 5%)
Dosing: Hepatic ImpairmentDosage reduction may be necessary in patients with liver dysfunction.
Administration: OralTablets may be chewed, swallowed whole, or crushed and mixed with food.
Dietary ConsiderationsTablet can be crushed and mixed with food, swallowed whole, or chewed.
ContraindicationsHypersensitivity to mebendazole or any component of the formulation
Allergy Considerations

- Benzimidazole Anthelmintics Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone marrow suppression: Neutropenia and agranulocytosis have been reported with high doses and prolonged use.

Disease-related concerns:

- Hydatid disease: Not effective for hydatid disease.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsSince only 2% to 10% of mebendazole is absorbed, it is unlikely that it is excreted in breast milk in significant quantities.
Adverse ReactionsFrequency not defined.

Cardiovascular: Angioedema

Central nervous system: Fever, dizziness, headache, seizure

Dermatologic: Rash, itching, alopecia (with high doses)

Gastrointestinal: Abdominal pain, diarrhea, nausea, vomiting

Hematologic: Neutropenia (sore throat, unusual fatigue)

Neuromuscular & skeletal: Unusual weakness

Drug Interactions

Aminoquinolines (Antimalarial): May decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

CarBAMazepine: May decrease the serum concentration of Mebendazole. *Risk D: Consider therapy modification*

MetroNIDAZOLE: Mebendazole may enhance the adverse/toxic effect of MetroNIDAZOLE. Particularly the risk for Stevens-Johnson Syndrome or Toxic Epidermal Necrolysis may be increased. *Risk D: Consider therapy modification*

Phenytoin: May decrease the serum concentration of Mebendazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Mebendazole serum levels may be increased if taken with food.
Monitoring ParametersCheck for helminth ova in feces within 3-4 weeks following the initial therapy
Nursing: Physical Assessment/MonitoringSince worm infestations are easily transmitted, all persons sharing same household should be treated. Teach proper use, transmission prevention, side effects/appropriate interventions, and adverse reactions to report.
Monitoring: Lab TestsCheck for helminth ova in feces within 3-4 weeks following the initial therapy. Periodically assess hematologic and hepatic function.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed for full course of medication. Tablets may be chewed, swallowed whole, or crushed and mixed with food. Increase dietary intake of fruit juices. All family members and close friends should also be treated. To reduce possibility of reinfection, wash hands and scrub nails carefully with soap and hot water before handling food, before eating, and before and after toileting. Keep hands out of mouth. Disinfect toilet daily and launder bed linens, undergarments, and nightclothes daily with hot water and soap. Do not go barefoot and do not sit directly on grass or ground. May cause abdominal pain, nausea, or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or hair loss (reversible). Report skin rash or itching, unusual fatigue or sore throat, unresolved diarrhea or vomiting, or CNS changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, chewable: 100 mg

Generic AvailableYes
ManufacturerMcNeil Consumer Products Co
Pricing: U.S. (www.drugstore.com)

Chewable (Mebendazole)

100 mg (1): $13.99

Mechanism of ActionSelectively and irreversibly blocks glucose uptake and other nutrients in susceptible adult intestine-dwelling helminths
Pharmacodynamics/Kinetics

Absorption: 2% to 10%

Distribution: To serum, cyst fluid, liver, omental fat, and pelvic, pulmonary, and hepatic cysts; highest concentrations found in liver; relatively high concentrations found in muscle-encysted *Trichinella spiralis* larvae; crosses placenta

Protein binding: 95%

Metabolism: Extensively hepatic

Half-life elimination: 1-11.5 hours

Time to peak, serum: 2-4 hours

Excretion: Primarily feces; urine (5% to 10%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentCarbamazepine may decrease the effects of mebendazole; may rarely cause neutropenia; use caution with clozapine and carbamazepine

Mecamylamine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Mecamylamine may be confused with mesalamine

Pronunciation(mek a MIL a meen)
U.S. Brand NamesInversine®
Canadian Brand NamesInversine®
Pharmacologic CategoryGanglionic Blocking Agent
Use: Labeled IndicationsTreatment of moderately severe to severe hypertension and in uncomplicated malignant hypertension
Use: Unlabeled/InvestigationalTourette's syndrome
Dosing: AdultsHypertension: Oral: 2.5 mg twice daily after meals for 2 days; increased by increments of 2.5 mg at intervals ≥2 days until desired blood pressure response is achieved; average daily dose: 25 mg (usually in 3 divided doses)

Note: Reduce dosage of other antihypertensives when combined with mecamylamine with exception of thiazide diuretics which may be maintained at usual dose while decreasing mecamylamine by 50%

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentUse with caution, if at all, although no specific guidelines are available.
Dietary ConsiderationsShould be taken after meals.
ContraindicationsCoronary insufficiency, pyloric stenosis, glaucoma, uremia, recent myocardial infarction, unreliable, uncooperative patients
Warnings/Precautions

Disease-related concerns:

- CNS abnormalities: Use with caution in patients with previous CNS abnormalities.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia, bladder obstruction, or urethral stricture; may cause urinary retention.
- Renal impairment: Use with caution in patients with renal impairment.

Other warnings/precautions:

- Abrupt discontinuation: Do not abruptly discontinue.

Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Cardiovascular: Postural hypotension

Central nervous system: Drowsiness, convulsions, confusion, mental depression

Endocrine & metabolic: Sexual ability decreased

Gastrointestinal: Xerostomia, loss of appetite, nausea, vomiting, bloating; frequent stools followed by severe constipation

Genitourinary: Dysuria

Neuromuscular & skeletal: Uncontrolled movements of hands, arms, legs, or face; trembling

Ocular: Blurred vision; enlarged pupils

Respiratory: Dyspnea

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersMonitor for orthostatic hypotension; aid with ambulation
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 2.5 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Inversine)

2.5 mg (30): $152.72

Mechanism of ActionMecamylamine is a ganglionic blocker. This agent inhibits acetylcholine at the autonomic ganglia, causing a decrease in blood pressure. Mecamylamine also blocks central nicotinic cholinergic receptors, which inhibits the effects of nicotine and may suppress the desire to smoke.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, confusion, or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsMecamylamine Hydrochloride

Jump To Field (Select Field Name)

Pronunciation(mek a SER min)

U.S. Brand NamesIncrelex™; Iplex™ [DSC]

Pharmacologic CategoryGrowth Hormone

Use: Labeled IndicationsTreatment of growth failure in children with severe primary insulin-like growth factor-1 deficiency (IGF-1 deficiency; primary IGFD), or with growth hormone (GH) gene deletions who have developed neutralizing antibodies to GH

Dosing: Pediatric

Primary IGFD: SubQ:

Increlex™: Children ≥2 years: Initial: 0.04-0.08 mg/kg twice daily; if tolerated for 7 days, may increase by 0.04 mg/kg/dose (maximum dose: 0.12 mg/kg given twice daily). Must be administered within 20 minutes of a meal or snack; omit dose if patient is unable to eat. Reduce dose if hypoglycemia occurs despite adequate food intake.

Iplex™: Children ≥3 years: Initial: 0.5 mg/kg once daily; dose may be increased to 1-2 mg/kg/day, given once daily. Withhold dose if hypoglycemia is present.

Administration: I.V.Do not administer I.V.

Administration: OtherFor SubQ injection only. Omit dose and do not make up for omitted dose if patient is unable to eat. Rotate injection site.

Increlex™: Must be administered within 20 minutes of a meal or snack. May cause hypoglycemic effects; patients should avoid high-risk activities within 2-3 hours of dosing until a tolerated dose is established.

Iplex™: Prior to administration, gently swirl vial; do not shake. Do not use if solution is cloudy (may indicate thawing during storage); do not use if stored at room temperature >2 hours. Dose should be administered once daily, at the same time each day. May cause hypoglycemic effects; patients should avoid high risk activities for 3-5 days until a tolerated dose is established. Withhold dose if hypoglycemia is present.

Dietary ConsiderationsIncrelex™ must be administered within 20 minutes of a meal or snack. Patients using Iplex™ should avoid missing meals and maintain a balanced diet.

Storage

Increlex™: Store under refrigeration at 2°C to 8°C (35°F to 46°F); do not freeze. Protect from direct light. After initial entry into vial, use within 30 days.

Iplex™: Must be kept frozen. Store at -70°C (-94°F) during distribution and at -20°C (-4°F) once in the patients home freezer. Transport to home freezer on dry ice. Do not use if product thaws during transportation or storage. If solution is cloudy, it may indicate that it has thawed during storage and should not bet used. May be stored up to 2 months at -20˚C (-4˚F). Prior to use, remove from freezer and allow to thaw at room temperature of 20˚C to 25˚C (68˚ to 77˚F) for ~45 minutes. Use within 1 hour of reaching room temperature. Do not use if vial was kept at room temperature for >2 hours.

ContraindicationsHypersensitivity to mecasermin or any component of the formulation; patients with closed epiphyses; active or suspected neoplasia

Warnings/Precautions

Concerns related to adverse effects:

- Hypoglycemia: May cause hypoglycemic effects; patients should avoid high risk activities until a tolerated dose is established. Do not administer on days a patient cannot or will not eat. Increlex™ should be administered with a meal or a snack; patients using Iplex™ should avoid missing meals and maintain a balanced diet.

- Intracranial hypertension (IH): With headache, nausea, papilledema, visual changes, and/or vomiting has been reported with growth hormone product, funduscopic examinations are recommended.

- Lymphoid hypertrophy: Has been reported and may lead to complications such as snoring, sleep apnea, and chronic middle-ear effusions.

- Progression of scoliosis: May occur in children experiencing rapid growth.

- Slipped capital epiphyses: Patients with growth hormone deficiency may develop slipped capital epiphyses more frequently, evaluate any child with new onset of a limp or with complaints of hip or knee pain.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes or with risk factors for glucose intolerance; may decrease insulin sensitivity.

Special populations:

- Adults: Safety and efficacy have not been established in adults.
- Pediatrics: Safety and efficacy have not been established in children <2 years of age (Increlex™) or <3 years of age (Iplex™).

Dosage form specific issues:

- Benzyl alcohol: Products may contain benzyl alcohol which may cause "gasping" syndrome in neonates.

Other warnings/precautions:

- Appropriate use: Correct thyroid or nutritional deficiencies prior to therapy. Not intended for use in patients with secondary forms of IGF-1 deficiency (GH deficiency, malnutrition, hypothyroidism, chronic anti-inflammatory steroid therapy).

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies
LactationExcretion in breast milk unknown/ use caution
Adverse Reactions

≥5%:

Cardiovascular: Cardiac murmur

Central nervous system: Convulsion, dizziness, headache (Iplex™: 22%)

Endocrine & metabolic: Hyper-/hypoglycemia (Increlex™: 42%; Iplex™ 31%), iron-deficiency anemia, ovarian cysts, thymus hypertrophy, thyromegaly

Gastrointestinal: Vomiting

Hepatic: Liver enzymes increased

Local: Injection site reactions: Erythema, bruising, hair growth, lipohypertrophy

Neuromuscular & skeletal: Arthralgia, bone pain, extremity pain, muscular atrophy

Ocular: Papilledema

Otic: Ear pain, hypoacusis, middle ear fluid, otitis media, serous otitis media, tympanometry abnormal

Renal: Hematuria

Respiratory: Snoring, tonsillar hypertrophy (Increlex™: 15%; Iplex™ 19%)

Miscellanous: Lymphadenopathy

<5% or frequency not defined: Hypoglycemic seizure, intracranial hypertension, loss of consciousness secondary to hypoglycemia, thickening of soft facial tissue

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersPreprandial glucose during treatment initiation and dose adjustment; facial features; lymphoid tissue; fundoscopic examination; growth; new onset of a limp or complaints of hip or knee pain. Monitor small children closely due to potentially erratic food intake.

Iplex™: Adjust dose based on IGF-1 level obtained 8-18 hours after previous dose.

Target treatment IGF-1 level: 0 to +2 SD score for age

Decrease dose for adverse events and/or IGF-1 levels ≥3 SD above normal

Reference RangeSevere primary IGFD is defined as follows:

Height standard deviation score ≤ -3.0 **and**

Basal IGF-1 standard deviation score ≤ -3.0 **and**

Growth hormone: Normal or elevated

Nursing: Physical Assessment/MonitoringMeasure height at the beginning of therapy and periodically during treatment. Teach signs of hypoglycemia and corrective actions if it should occur. Instruct parents in proper subcutaneous administration techniques and appropriate disposal of needles. Monitor injection sites and teach parents to rotate injection sites. Assess for signs of enlarged tonsils. Monitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy.
Monitoring: Lab TestsPreprandial glucose during treatment initiation and dose adjustment; fundoscopic examination; growth

Iplex™: Adjust dose based on IGF-1 level obtained 8-18 hours after previous dose.

Target treatment IGF-1 level: 0 to +2 SD score for age

Decrease dose for adverse events and/or IGF-1 levels ≥3 SD above normal

Patient EducationFor subcutaneous injection only. You will be instructed on the proper injection technique and disposal of needles. Must be administered shortly before or after a meal or snack. May cause hypoglycemia. Rotate injection sites. Administer per the directions of the prescriber. Do not alter dosage unless instructed to do so. Do not make up a missed dose by giving two doses. Do not administer if unable to eat. May cause enlarged tonsils. Report increased snoring, difficulty breathing or swallowing, sleep apnea, severe headaches, vomiting, hip or knee pain, or walking with a limp.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Increlex™: 10 mg/mL (4 mL) [contains benzyl alcohol]

Injection, solution, as rinfabate [preservative free]:

Iplex™: 36 mg/0.6 mL (0.6 mL) [DSC]

Generic AvailableNo

Mechanism of ActionMecasermin is an insulin-like growth factor (IGF-1) produced using recombinant DNA technology to replace endogenous IGF-1. Endogenous IGF-1 circulates predominately bound to insulin-like growth factor-binding protein-3 (IGFBP-3) and a growth hormone-dependent acid-labile subunit (ALS). Acting at receptors in the liver and other tissues, endogenous growth hormone (GH) stimulates the synthesis and secretion of IGF-1. In patients with primary severe IGF-1 deficiency, growth hormone receptors in the liver are unresponsive to GH, leading to reduced endogenous IGF-I concentrations and decreased growth (skeletal, cell, and organ). Endogenous IGF-1 also suppresses liver glucose production, stimulates peripheral glucose utilization and has an inhibitory effect on insulin secretion.

Mecasermin rinfabate is a complex of IGF-1 and IGFBP-3, both produced by recombinant DNA technology.

Pharmacodynamics/Kinetics

Distribution: V_d: Severe primary IGFD: 0.184-0.33 L/kg

Protein binding: >80% bound to IGFBP-3 and an acid-labile subunit (IGFBP-3 reduced with severe primary IGFD)

Metabolism: Hepatic and renal

Half-life elimination: Severe primary IGFD: Mecasermin: 5.8 hours; Mecasermin rinfabate: >12 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsMecasermin (rDNA Origin) ; Mecasermin Rinfabate; Recombinant Human Insulin-Like Growth Factor-1; rhIGF-1; rhIGF-1/rhIGFBP-3

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(me klor ETH a meen)

U.S. Brand NamesMustargen®

Canadian Brand NamesMustargen®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent (Nitrogen Mustard)

Use: Labeled IndicationsHodgkin's disease; non-Hodgkin's lymphoma; intracavitary injection for treatment of metastatic tumors; pleural and other malignant effusions; topical treatment of mycosis fungoides

Dosing: AdultsRefer to individual protocols. Dosage should be based on ideal dry weight. The presence of edema or ascites must be considered so that dosage will be based on actual weight unaugmented by these conditions.

MOPP: I.V.: 6 mg/m^2 on days 1 and 8 of a 28-day cycle

Typical dose: I.V.: 0.4 mg/kg **or** 12-16 mg/m^2 for one dose **or** divided into 0.1 mg/kg/day for 4 days, repeated at 4- to 6-week intervals

Intracavitary: 10-20 mg diluted in 10 mL of SWI or 0.9% sodium chloride

Intrapericardially: 0.2-0.4 mg/kg diluted in up to 100 mL of 0.9% sodium chloride

Mycosis fungoides: Topical mechlorethamine has been used in the treatment of cutaneous lesions of mycosis fungoides. A skin test should be performed prior to treatment with the topical preparation to detect sensitivity and possible irritation (use fresh mechlorethamine 0.1 mg/mL and apply over a 3 x 5 cm area of normal skin).

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols. Dosage should be based on ideal dry weight; the presence of edema or ascites must be considered so that dosage will be based on actual weight unaugmented by these conditions.

MOPP: Children: I.V.: 6 mg/m^2 on days 1 and 8 of a 28-day cycle

Dosing: Renal Impairment

Hemodialysis: Not removed; supplemental dosing is not necessary.

Peritoneal dialysis: Not removed; supplemental dosing is not necessary.

Dosing: Combination Regimens

Brain tumors:

MOP

MOPP (Medulloblastoma)

Lymphoma, Hodgkin's:

CAD/MOPP/ABV

MOPP (Lymphoma, Hodgkin's Disease)

MOPP/ABV Hybrid

MOPP/ABVD

MVPP

Stanford V Regimen

Oncology: Bone Marrow - High DoseI.V.: 0.3-2 mg/kg

Calculations

- Body Surface Area: Adults

- Body Surface Area: Pediatrics

Administration: I.V.Vesicant. Margin of error is very slight. Check dosage carefully before administration. Administer with caution. Administer I.V. push through a free-flowing I.V. over 1-3 minutes at a concentration not to exceed 1 mg/mL.
Administration: I.V. DetailMechlorethamine may cause extravasation. Use within 1 hour of preparation. Avoid extravasation since mechlorethamine is a potent vesicant.

pH: 3-5

StorageStore intact vials at room temperature. Solution is stable for only 15-60 minutes after dilution
ReconstitutionMust be prepared immediately before use. Dilute powder with 10 mL SWI to a final concentration of 1 mg/mL. May be diluted in up to 100 mL NS for intracavitary or topical administration.
CompatibilityStable in sterile water for injection; **incompatible** with D_5W; **variable stability (consult detailed reference)** in NS.

Y-site administration: Compatible: Amifostine, aztreonam, filgrastim, fludarabine, granisetron, melphalan, ondansetron, sargramostim, teniposide, vinorelbine. **Incompatible:** Allopurinol, cefepime.

Compatibility when admixed: Incompatible: Methohexital.

ContraindicationsHypersensitivity to mechlorethamine or any component of the formulation; pre-existing profound myelosuppression or infection
Allergy Considerations

- Nitrogen Mustard Allergy

Warnings/Precautions

Boxed warnings:

- Experienced physician: See “Other warnings/precautions” below.
- Extravasation: See “Other warnings/precautions” below.
- Hazardous agent: See “Special handling” below.
- Pregnancy: See “Special populations” below.

Special handling:

- Hazardous agent: **[U.S. Boxed Warning]: Use appropriate precautions for handling and disposal.** Avoid contact with skin or eyes.

Concerns related to adverse effects:

- Bone marrow suppression: May cause lymphopenia, granulocytopenia, thrombocytopenia and anemia.
- Hyperuricemia: May occur, especially with lymphomas; ensure adequate hydration.

Special populations:

- Pregnancy: **[U.S. Boxed Warning]: Avoid exposure during pregnancy.**

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**
- Extravasation: **[U.S. Boxed Warning]: Mechlorethamine is a potent vesicant; if extravasation occurs, severe tissue damage (leading to ulceration and necrosis) and pain may occur.** Sodium thiosulfate should be available for treatment of extravasation.

Pregnancy Risk FactorD
Pregnancy ConsiderationsAnimal studies have demonstrated teratogenic effects. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential are advised not to become pregnant. Use only when potential benefit justifies potential risk to the fetus. **[U.S. Boxed Warning]: Avoid exposure during pregnancy.**
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsIt is not known if mechlorethamine is excreted in human breast milk. Due to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions

>10%:

Dermatologic: Alopecia; hyperpigmentation of veins; contact and allergic dermatitis (50% with topical use)

Endocrine & metabolic: Chromosomal abnormalities, delayed menses, oligomenorrhea, amenorrhea, impaired spermatogenesis

Gastrointestinal: Nausea and vomiting (almost 100%), onset may be within minutes of drug administration

Genitourinary: Azoospermia

Hematologic: Myelosuppression, leukopenia, and thrombocytopenia

Onset: 4-7 days

Nadir: 14 days

Recovery: 21 days

1% to 10%:

Central nervous system: Fever

Gastrointestinal: Diarrhea, anorexia, metallic taste

Otic: Tinnitus

<1%: Vertigo, rash, hemolytic anemia, hepatotoxicity, weakness, peripheral neuropathy

Oncology: VesicantYes; see Management of Drug Extravasations.
Oncology: Emetic PotentialVery high (>90%)
Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to GI irritation).
Monitoring ParametersCBC with differential, hemoglobin, and platelet count
Nursing: Physical Assessment/MonitoringThis is a powerful vesicant; see Administration for infusion specifics. Premedication with antiemetic recommended (highly emetogenic; emesis may begin within minutes of starting infusion). Infusion site must be closely monitored; extravasation can cause severe sloughing or tissue necrosis. Assess results of laboratory tests prior to each treatment and on a regular basis throughout therapy. Patient must be monitored closely during infusion and between treatments (eg, adverse reactions can be severe and involve several systems). Teach patient possible side effects/appropriate interventions (eg, importance of adequate hydration) and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential and platelet count
Patient EducationThis medication can only be given by infusion. Report immediately any swelling, redness, pain, or burning at infusion site. Do not use alcohol during treatment; may increase gastric irritation. Maintain adequate fluid balance (2-3 L/day) unless instructed to restrict fluid intake, and adequate nutrition (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may reduce anorexia and nausea). May cause discoloration (brown color) of veins used for infusion; hair loss (reversible); easy bleeding or bruising (use soft toothbrush or cotton swabs and frequent mouth care, use electric razor, avoid sharp knives or scissors); or increased susceptibility to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). This drug may cause menstrual irregularities, permanent sterility, and birth defects. Report changes in auditory or visual acuity; unusual bleeding or bruising or persistent fever or sore throat; blood in urine, stool, or vomitus; delayed healing of any wounds; skin rash; yellowing of skin or eyes; changes in color of urine of stool; acute or unresolved nausea or vomiting; diarrhea; or loss of appetite. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Do not get pregnant while taking this medication and for 1 month following therapy; consult prescriber for appropriate barrier contraceptives if necessary or if you suspect you might be pregnant. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as hydrochloride: 10 mg

Generic AvailableNo
Mechanism of ActionBifunctional alkylating agent that inhibits DNA and RNA synthesis via formation of carbonium ions; cross-links strands of DNA, causing miscoding, breakage, and failure of replication; produces interstrand and intrastrand cross-links in DNA resulting in miscoding, breakage, and failure of replication. Although not cell phase-specific *per se,* mechlorethamine effect is most pronounced in the S phase, and cell proliferation is arrested in the G_2 phase.
Pharmacodynamics/Kinetics

Duration: Unchanged drug is undetectable in blood within a few minutes

Absorption: Intracavitary administration: Incomplete secondary to rapid deactivation by body fluids

Metabolism: Rapid hydrolysis and demethylation, possibly in plasma

Half-life elimination: <1 minute

Excretion: Urine (50% as metabolites, <0.01% as unchanged drug)

Related Information

- Management of Drug Extravasations

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; avoid use with clozapine and carbamazepine

International Brand Names Caryolysine (FR); Mustargen (IL, MX); Mustine Hydrochloride Boots (MY); Nitromin (JP)

Meclizine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Antivert® may be confused with Axert™

Pronunciation(MEK li zeen)

U.S. Brand NamesAntivert®; Bonine® [OTC]; Dramamine® Less Drowsy Formula [OTC]; Medi-Meclizine [OTC]

Canadian Brand NamesBonamine™; Bonine®

Pharmacologic CategoryAntiemetic; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsPrevention and treatment of symptoms of motion sickness; management of vertigo with diseases affecting the vestibular system

Dosing: Adults

Motion sickness: Oral: 12.5-25 mg 1 hour before travel, repeat dose every 12-24 hours if needed; doses up to 50 mg may be needed

Vertigo: Oral: 25-100 mg/day in divided doses

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >12 years: Refer to adult dosing.

ContraindicationsHypersensitivity to meclizine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Pyloric/duodenal obstruction: Use with caution in patients with pyloric or duodenal obstruction.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Other warnings/precautions:

- Lack of response: If vertigo does not respond in 1-2 weeks, it is advised to discontinue use.

Geriatric ConsiderationsDue to anticholinergic action, use lowest dose in divided doses to avoid side effects and their inconvenience. Limit use if possible. May cause confusion or aggravate symptoms of confusion in those with dementia. If vertigo does not respond in 1-2 weeks, discontinue use.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNo data available on crossing the placenta. Probably no effect on the fetus (insufficient data). Available evidence suggests safe use during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Slight to moderate drowsiness

Respiratory: Thickening of bronchial secretions

1% to 10%:

Central nervous system: Headache, fatigue, nervousness, dizziness

Gastrointestinal: Appetite increase, weight gain, nausea, diarrhea, abdominal pain, xerostomia

Respiratory: Pharyngitis

<1%: Palpitation, hypotension, depression, sedation, photosensitivity, rash, angioedema, urinary retention, hepatitis, myalgia, tremor, paresthesia, blurred vision, bronchospasm, epistaxis

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringDetermine cause of vomiting before beginning therapy. Assess effectiveness and interactions of other medications patient may be taking. Monitor effectiveness of therapy and adverse response. Assess knowledge/teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationTake exactly as prescribed; do not increase dose. Avoid alcohol, other CNS depressants, sleeping aids without consulting prescriber. You may experience dizziness, drowsiness, or blurred vision (use caution when driving or engaging in tasks that require alertness until response to drug is known); dry mouth (frequent mouth care, sucking lozenges, or chewing gum may help); constipation (increased exercise, fluids, fruit, or may help); or heat intolerance (avoid excessive exercise, hot environments, maintain adequate hydration). Report CNS change (hallucination, confusion, nervousness); sudden or unusual weight gain; unresolved nausea or diarrhea; chest pain or palpitations; muscle pain; or changes in urinary pattern. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 12.5 mg, 25 mg

Antivert®: 12.5 mg, 25 mg, 50 mg

Dramamine® Less Drowsy Formula: 25 mg

Medi-Meclizine: 25 mg

Tablet, chewable, as hydrochloride (Bonine®): 25 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Antivert)

12.5 mg (30): $27.29

25 mg (30): $36.74

50 mg (30): $59.52

Tablets (Meclizine HCl)

12.5 mg (30): $12.99

25 mg (30): $19.99

25 mg (100): $79.99

Mechanism of ActionHas central anticholinergic action by blocking chemoreceptor trigger zone; decreases excitability of the middle ear labyrinth and blocks conduction in the middle ear vestibular-cerebellar pathways

Pharmacodynamics/Kinetics

Onset of action: ~1 hour

Duration: 8-24 hours

Metabolism: Hepatic

Half-life elimination: 6 hours

Excretion: Urine (as metabolites); feces (as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Slight to moderate drowsiness, thickening of bronchial secretions, significant xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause dizziness or nervousness; may rarely cause sedation or depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropic may produce additive sedation and dry mouth

Index TermsMeclizine Hydrochloride; Meclozine Hydrochloride

Meclofenamate

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(me kloe fen AM ate)

Canadian Brand NamesMeclomen®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsTreatment of inflammatory disorders, arthritis, mild to moderate pain, dysmenorrhea

Dosing: Adults

Mild to moderate pain: Oral: 50 mg every 4-6 hours; increases to 100 mg may be required; maximum dose: 400 mg

Rheumatoid arthritis/osteoarthritis: Oral: 50 mg every 4-6 hours; increase, over weeks, to 200-400 mg/day in 3-4 divided doses; do not exceed 400 mg/day; maximal benefit for any dose may not be seen for 2-3 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >14 years: Refer to adult dosing

Dietary ConsiderationsMay be taken with food, milk, or antacids.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to meclofenamate, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.
- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.
- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT.

Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children <14 years of age.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsMay cause premature closure of the ductus arteriosus in the 3rd trimester of pregnancy.

Lactation

Enters breast milk/not recommended

Adverse Reactions

>10%:

Central nervous system: Dizziness

Dermatologic: Rash

Gastrointestinal: Abdominal cramps, heartburn, indigestion, nausea

1% to 10%:

Central nervous system: Headache, nervousness

Dermatologic: Itching

Endocrine & metabolic: Fluid retention

Gastrointestinal: Vomiting

Otic: Tinnitus

<1%: CHF, hypertension, arrhythmia, tachycardia, confusion, hallucinations, aseptic meningitis, mental depression, drowsiness, insomnia, urticaria, erythema multiforme, toxic epidermal necrolysis, Stevens-Johnson syndrome, angioedema, polydipsia, hot flashes, gastritis, GI ulceration, cystitis, polyuria, agranulocytosis, anemia, hemolytic anemia, bone marrow suppression, leukopenia, thrombocytopenia, hepatitis, peripheral neuropathy, toxic amblyopia, blurred vision, conjunctivitis, dry eyes, decreased hearing, acute renal failure, allergic rhinitis, dyspnea, epistaxis

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol;

Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsIncreased chloride (S), increased sodium (S)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as sodium: 50 mg, 100 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Meclofenamate Sodium)

50 mg (30): $24.99

100 mg (30): $34.64

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Duration: 2-4 hours

Distribution: Crosses placenta

Protein binding: 99%

Half-life elimination: 2-3.3 hours

Time to peak, serum: 0.5-1.5 hours

Excretion: Primarily urine and feces (as metabolites)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®). Recovery of platelet function usually occurs 1-2 days after discontinuation of NSAIDs.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause drowsiness, confusion, hallucinations, or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine or carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin’s inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Index TermsMeclofenamate Sodium

Medium Chain Triglycerides

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(mee DEE um chane trye GLIS er ides)

U.S. Brand NamesMCT Oil® [OTC]

Canadian Brand NamesMCT Oil®

Pharmacologic Category[Nutritional Supplement]

Use: Labeled IndicationsDietary supplement for those who cannot digest long chain fats; malabsorption associated with disorders such as pancreatic insufficiency, bile salt deficiency, short bowel syndrome, and bacterial overgrowth of the small bowel; induce ketosis as a prevention for seizures

Dosing: Adults

Cystic fibrosis: 3 tablespoons/day in divided doses

Malabsorption syndromes: Oral: 15 mL 3-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Nutritional supplement:

Infants: Oral: Initial: 0.5 mL every other feeding, then advance to every feeding, then increase in increments of 0.25-0.5 mL/feeding at intervals of 2-3 days as tolerated

Seizures: Oral: About 40 mL with each meal or 50% to 70% (800-1120 kcal) of total calories (1600 kcal) as the oil will induce ketosis necessary for seizure control

Cystic fibrosis: Oral: 3 tablespoons/day in divided doses

Administration: OralDilute with at least an equal volume of water or mix with some other vehicle such as fruit juice (flavoring may be added); mixture should be sipped slowly; administer no more than 15-20 mL at any one time (up to 100 mL may be administered in divided doses in a 24-hour period); formulas should not be cold. May also be used on salads or vegetables; may incorporate into sauces or used in cooking or baking.

Possible gastrointestinal side effects from medication can be prevented if therapy is initiated with small supplements at meals and gradually increased according to patient's tolerance

Dietary ConsiderationsMay be taken with meals (115 calories/15 mL); derived from coconut oil

StorageAfter opening, keep tightly closed and use within 3 months.

Adverse ReactionsFrequency not defined.

Endocrine & metabolic: HDL serum levels decreased and triglycerides serum levels increased (>6 months daily use)

Gastrointestinal: Abdominal pain, bloating, cramping, diarrhea, nausea

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Oil: 14 g/15 mL (960 mL) [115 calories/15 mL; derived from coconut oil]

Generic AvailableNo

Mechanism of ActionMCTs are saturated fatty acids in chains of 6-12 carbon atoms. They are water soluble and can pass directly through intestinal cell membranes and blood stream. Once taken up by the liver, they are used for metabolic energy before being stored.

Pharmacotherapy PearlsMay damage plastic containers and utensils. In patients with steatorrhea, MCT increases usable caloric intake; weight gain is increased; diarrhea and steatorrhea are decreased; calcium and magnesium absorption are increased.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay produce coma in cirrhotic patients

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsMCT; Triglycerides, Medium Chain

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

MedroxyPROGESTERone may be confused with hydroxyprogesterone, methylPREDNISolone, methylTESTOSTERone

Provera® may be confused with Covera®, Femara®, Parlodel®, Premarin®

The injection dosage form is available in different formulations. Carefully review prescriptions to assure the correct formulation and route of administration.

Pronunciation(me DROKS ee proe JES te rone)

U.S. Brand NamesDepo-Provera®; Depo-Provera® Contraceptive; depo-subQ provera 104™; Provera®

Canadian Brand NamesAlti-MPA; Apo-Medroxy®; Depo-Prevera®; Depo-Provera®; Gen-Medroxy; Novo-Medrone; Provera-Pak; Provera®

Pharmacologic CategoryContraceptive; Progestin

Use: Labeled IndicationsEndometrial carcinoma or renal carcinoma; secondary amenorrhea or abnormal uterine bleeding due to hormonal imbalance; reduction of endometrial hyperplasia in nonhysterectomized postmenopausal women receiving conjugated estrogens; prevention of pregnancy; management of endometriosis-associated pain

Dosing: Adults

Amenorrhea: Oral: 5-10 mg/day for 5-10 days

Abnormal uterine bleeding: Oral: 5-10 mg for 5-10 days starting on day 16 or 21 of cycle

Contraception:

Depo-Provera® Contraceptive: I.M.: 150 mg every 3 months

depo-subQ provera 104™: SubQ: 104 mg every 3 months (every 12-14 weeks)

Endometriosis: depo-subQ provera 104™: SubQ: 104 mg every 3 months (every 12-14 weeks)

Endometrial or renal carcinoma (Depo-Provera®): I.M.: 400-1000 mg/week

Accompanying cyclic estrogen therapy, postmenopausal: Oral: 5-10 mg for 12-14 consecutive days each month, starting on day 1 or day 16 of the cycle; lower doses may be used if given with estrogen continuously throughout the cycle

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricAdolescents:

Amenorrhea: Refer to adult dosing.

Abnormal uterine bleeding: Refer to adult dosing.

Contraception: Refer to adult dosing.

Endometriosis: Refer to adult dosing.

Dosing: Hepatic ImpairmentUse is contraindicated with severe impairment. Consider lower dose or less frequent administration with mild-to-moderate impairment. Use of the contraceptive injection has not been studied in patients with hepatic impairment; consideration should be given to not readminister if jaundice develops

Administration: I.M.Depo-Provera® Contraceptive: Administer first dose during the first 5 days of menstrual period, or within the first 5 days postpartum if not breast-feeding, or at the sixth week postpartum if breast feeding exclusively. Shake vigorously prior to administration. Administer by deep I.M. injection in the gluteal or deltoid muscle.

Administration: OtherSubQ: depo-subQ provera 104™: Administer first dose during the first 5 days of menstrual period, or at the sixth week postpartum if breast-feeding. Shake vigorously prior to administration. Administer by SubQ injection in the upper thigh or abdomen; avoid boney areas and the umbilicus. Administer over 5-7 seconds. Do not rub the injection area. When switching from combined hormonal contraceptives (estrogen plus progestin), the first injection should be within 7 days after the last active pill, or removal of patch or ring. If switching from the I.M. to SubQ formulation, the next dose should be given within the prescribed dosing period for the I.M. injection.

Dietary ConsiderationsEnsure adequate calcium and vitamin D intake when used for the prevention of pregnancy

StorageStore at controlled room temperature.

ContraindicationsHypersensitivity to medroxyprogesterone or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); cerebral vascular disease; severe hepatic dysfunction or disease; carcinoma of the breast or genital organs, undiagnosed vaginal bleeding; missed abortion, diagnostic test for pregnancy, pregnancy

Warnings/Precautions

Boxed warnings:

- Bone mineral density loss: See “Concerns related to adverse effects” below.
- Long-term use: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Bone mineral density loss: **[U.S. Boxed Warning]: Prolonged use of medroxyprogesterone contraceptive injection may result in a loss of bone mineral density (BMD).** Loss is related to the duration of use, and may not be completely reversible on discontinuation of the drug. The impact on peak bone mass in adolescents should be considered in treatment decisions.
- Breast cancer: An increased risk of invasive breast cancer was observed in postmenopausal women using medroxyprogesterone acetate (MPA) in combination with conjugated equine estrogens (CEE). An increase in abnormal mammograms has also been reported with estrogen and progestin therapy.
- Dementia: The risk of dementia may be increased in postmenopausal women; increased incidence was observed in women ≥65 years of age taking MPA in combination with CEE.
- Retinal vascular thrombosis: Discontinue pending examination in cases of sudden partial or complete vision loss, sudden onset of proptosis, diplopia, or migraine; discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease or dysfunction. MPA used in combination with estrogen may increase the risks of hypertension, myocardial infarction (MI), stroke, pulmonary emboli (PE), and deep vein thrombosis; incidence of these effects was shown to be significantly increased in postmenopausal women using CEE in combination with MPA. MPA in combination with estrogens should not be used to prevent coronary heart disease.
- Depression: Use with caution in patients with a history of depression.
- Diabetes: Use with caution in patients with diabetes mellitus; may cause glucose intolerance.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes, or renal dysfunction.
- Osteoporosis: Consider other methods of birth control in women with (or at risk for) osteoporosis.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Surgical patients: Whenever possible, progestins in combination with estrogens should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- Long-term use: **[U.S. Boxed Warning]: Long-term use (ie, >2 years) should be limited to situations where other birth control methods are inadequate.**
- Risks vs. benefits: Before prescribing progestin therapy in combination with estrogen to postmenopausal women, the risks and benefits must be weighed for each patient. Women should be informed of these risks and benefits, as well as possible effects of estrogen when added to progestin therapy. Progestins with or without estrogen should be used for shortest duration possible consistent with treatment goals. Conduct periodic risk:benefit assessments.

Pregnancy Risk FactorX

Pregnancy ConsiderationsThere is an increased risk of minor birth defects in children whose mothers take progesterones during the first 4 months of pregnancy. Hypospadias has been reported in male and mild masculinization of the external genitalia has been reported in female babies exposed during the first trimester. High doses are used to impair fertility. Low birth weight has been reported in neonates from unexpected pregnancies which occurred 1-2 months following injection of medroxyprogesterone (MPA) contraceptive. Ectopic pregnancies have been reported with use of the MPA contraceptive injection. When therapy is discontinued, fertility returns sooner in women of lower body weight. Median time to conception/return to ovulation following discontinuation of MPA contraceptive injection is 10 months following the last injection.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsComposition, quality and quantity of breast milk are not affected; adverse developmental and behavioral effects have not been noted following exposure of infant to MPA while breast-feeding.

Adverse ReactionsAdverse effects as reported with any dosage form; percent ranges presented are noted with the MPA contraceptive injection:

>5%:

Central nervous system: Dizziness, headache, nervousness

Endocrine & metabolic: Libido decreased, menstrual irregularities (includes bleeding, amenorrhea, or both)

Gastrointestinal: Abdominal pain/discomfort, weight changes (average 3-5 pounds after 1 year, 8 pounds after 2 years)

Neuromuscular & skeletal: Weakness

1% to 5%:

Cardiovascular: Edema

Central nervous system: Depression, fatigue, insomnia, irritability, pain

Dermatologic: Acne, alopecia, rash

Endocrine & metabolic: Anorgasmia, breast pain, hot flashes

Gastrointestinal: Bloating, nausea

Genitourinary: Cervical smear abnormal, leukorrhea, menometrorrhagia, menorrhagia, pelvic pain, urinary tract infection, vaginitis, vaginal infection, vaginal hemorrhage

Local: Injection site atrophy, injection site reaction, injection site pain

Neuromuscular & skeletal: Arthralgia, backache, leg cramp

Respiratory: Respiratory tract infections

<1%: Allergic reaction, anemia, angioedema, appetite changes, asthma, axillary swelling, blood dyscrasia, body odor, breast cancer, breast changes, cervical cancer, chest pain, chills, chloasma, convulsions, deep vein thrombosis, diaphoresis, drowsiness, dry skin, dysmenorrhea, dyspareunia, dyspnea, facial palsy, fever, galactorrhea, genitourinary infections, glucose tolerance decreased, hirsutism, hoarseness, jaundice, lack of return to fertility, lactation decreased, libido increased, melasma, nipple bleeding, osteoporosis, paralysis, paresthesia, pruritus, pulmonary embolus, rectal bleeding, scleroderma, sensation of pregnancy, somnolence, syncope, tachycardia, thirst, thrombophlebitis, uterine hyperplasia, vaginal cysts, varicose veins; residual lump, sterile abscess, or skin discoloration at the injection site

Postmarketing and/or case reports: Anaphylaxis, anaphylactoid reactions, bone mineral density decreased, osteoporotic fractures

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Induces** CYP3A4 (weak)
Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of osteoporosis).

Food: Bioavailability of the oral tablet is increased when taken with food; half-life is unchanged.

Herb/Nutraceutical: St John's wort may diminish the therapeutic effect of progestin contraceptives (contraceptive failure is possible).

Test Interactions

The following tests may be decreased: Steroid levels (plasma and urinary), gonadotropin levels, SHBG concentration, T_3 uptake

The following tests may be increased: Protein-bound iodine, butanol extractable protein-bound iodine, Factors II, VII, VIII, IX, X

Pathologist should be advised of estrogen/progesterone therapy when specimens are submitted.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate prior to administration of MPA contraceptive injection; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision; sudden onset of proptosis, diplopia, or migraine; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glucose in patients with diabetes; or blood pressure.

Nursing: Physical Assessment/MonitoringMonitor for effectiveness of therapy and adverse effects. Instruct patient on appropriate dose scheduling (according to purpose of therapy), possible side effects, and symptoms to report. **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to sexually-active female patients unless capable of complying with contraceptive use.

Monitoring: Lab Tests**Must have pregnancy test prior to beginning therapy.**

Patient EducationFollow dosage schedule and do not take more than prescribed. You may experience sensitivity to sunlight (use sunblock, wear protective clothing and eyewear, and avoid extensive exposure to direct sunlight); dizziness, anxiety, depression (use caution when driving or engaging in tasks that require alertness until response to drug is known); changes in appetite; maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and diet; decreased libido or increased body hair (reversible when drug is discontinued); hot flashes (cool clothes and environment may help). May cause discoloration of stool (green). Report swelling of face, lips, or mouth; absence or altered menses; abdominal pain; vaginal itching, irritation, or discharge; heat, warmth, redness, or swelling of extremities; or sudden onset change in vision. **Pregnancy precaution:** Inform prescriber if you are pregnant. Consult prescriber for instruction on appropriate contraceptive measures.

Injection for contraception: This product does not protect against HIV or other sexually-transmitted diseases.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension, as acetate: 150 mg/mL (1 mL)

Depo-Provera®: 400 mg/mL (2.5 mL)

Depo-Provera® Contraceptive: 150 mg/mL (1 mL) [prefilled syringe or vial]

depo-subQ provera 104™: 104 mg/0.65 mL (0.65 mL) [prefilled syringe]

Tablet, as acetate: 2.5 mg, 5 mg, 10 mg

Provera®: 2.5 mg, 5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Suspension (Depo-Provera)

150 mg/mL (1): $87.99

400 mg/mL (2.5): $178.24

Suspension (Depo-SubQ Provera 104)

104 mg/0.65 mL (0.65): $104.81

Suspension (MedroxyPROGESTERone Acetate)

150 mg/mL (1): $49.99

150 mg/mL (1): $52.99

Tablets (MedroxyPROGESTERone Acetate)

2.5 mg (30): $12.99

5 mg (90): $19.00

10 mg (30): $12.99

Tablets (Provera)

2.5 mg (30): $37.79

5 mg (30): $47.24

10 mg (30): $57.32

Mechanism of ActionInhibits secretion of pituitary gonadotropins, which prevents follicular maturation and ovulation; causes endometrial thinning

Pharmacodynamics/Kinetics

Absorption: Oral: Well absorbed; I.M.: Slow

Protein binding: 86% to 90% primarily to albumin; does not bind to sex hormone-binding globulin

Metabolism: Extensively hepatic via hydroxylation and conjugation; forms metabolites

Time to peak: Oral: 2-4 hours

Half-life elimination: Oral: 12-17 hours; I.M. (Depo-Provera® Contraceptive): 50 days; SubQ: ~40 days

Excretion: Urine

Dental Health: Effects on Dental TreatmentProgestins may predispose the patient to gingival bleeding.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, headache, depression, insomnia, nervousness, irritability, and mood disturbances

Mental Health: Effects on Psychiatric TreatmentThe Women's Health Initiative (WHI) Memory Study reported an increased risk of developing dementia in postmenopausal women ≥65 years of age during 4 years of treatment with oral conjugated equine estrogens and medroxyprogesterone acetate relative to placebo (1.8% vs 0.9%). Relative risk was 2.05 (95% CI 1.21-3.48). Therefore, estrogens and progestins should not be used for the prevention of dementia. The WHI also reported an increased risk of stroke (29 vs 21 per 10,000 women-years) compared to women receiving placebo. The increase in risk was observed after the first year and persisted. May cause hypertriglyceridemia; monitor in patients receiving antipsychotics especially clozapine, olanzapine, and quetiapine.

Index TermsAcetoxymethylprogesterone; Medroxyprogesterone Acetate; Methylacetoxyprogesterone; MPA

International Brand NamesApo-Medroxy (HK); Climanor (GB, IE); Clinofem (DE); Condep (MY); Cycrin (AR, BR); Depo-M (TH); Depo-Prodasone (FR); Depo-Provera (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, PL, QA, SA, SY, YE); Deporeva (PH); Depotrust (PH); Enaf-150 (TH); Farlutal (AE, BE, BH, BR, CY, EG, FR, IL, IQ, IR, IT, JO, KW, LB, LY, NL, OM, PL, QA, SA, SY, YE); GestaPolar (DE); Gestapuran (FI, SE); Gestomikron (PL); Lyndavel (PH); Manodepa (TH); Medrone (TW); Medroxine (PY, UY); Medroxyhexal (AU); Megestron (MX); Meprate (IN); MPA Gyn 5 (DE); Perlutex (BB, BM, BS, BZ, DK, GY, JM, NO, SR, TT); Perlutex Leo (CR, DO, GT, HN, NI, PA, SV); Planibu (ID); Prodafem (AT, CH); Progevera (ES); Provera (AE, AU, BE, BF, BG, BH, BJ, CI, CL, CN, CO, CY, CZ, DK, EC, EE, EG, ET, FI, GB, GH, GM, GN, GR, HK, HN, ID, IE, IL, IN, IQ, IR, IT, JO, KE, KP, KW, LB, LR, LY, MA, ML, MR, MU, MW, MX, NE, NG, NL, NO, OM, PE, PH, PL, PT, QA, RU, SA, SC, SD, SE, SL, SN, SY, TH, TN, TW, TZ, UG, VE, YE, ZA, ZM, ZW); Provera LD (MY); Ralovera (AU); Triclofem (ID); Veraplex (ID, TH)

Medrysone

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(ME dri sone)

U.S. Brand NamesHMS Liquifilm® [DSC]

Pharmacologic CategoryCorticosteroid, Ophthalmic

Use: Labeled IndicationsTreatment of allergic conjunctivitis, vernal conjunctivitis, episcleritis, ophthalmic epinephrine sensitivity reaction

Dosing: AdultsConjunctivitis: Ophthalmic: Instill 1 drop in conjunctival sac 2-4 times/day up to every 4 hours; may use every 1-2 hours during first 1-2 days.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥3 years: Refer to adult dosing.

Administration: OtherOphthalmic: Shake well before using. Do not touch dropper to the eye.

StorageStore at room temperature of 25°C (77°F); do not freeze.

ContraindicationsHypersensitivity to medrysone or any component of the formulation; fungal, viral, or untreated pus-forming bacterial ocular infections; not for use in iritis and uveitis

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Infection: Steroids may mask infection or enhance existing ocular infection; prolonged use may result in secondary infections due to immunosuppression.
- Ocular effects: Prolonged use may result in glaucoma and injury to the optic nerve. Visual defects in acuity and field of vision may occur. Posterior subcapsular cataracts may form after long-term use. Use with caution in presence of glaucoma (steroids increase intraocular pressure). Perforation may occur with topical steroids in diseases which thin the cornea or sclera. Steroid use may delay healing after cataract surgery. Intraocular pressure should be monitored if this product is used >10 days.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 years of age.

Other warnings/precautions:

- Duration of therapy: 3-4 days to several weeks dependent on type and severity of disease; taper dose to avoid disease exacerbation.
- Lack of improvement: If no improvement after several days of treatment, discontinue medrysone and institute other therapy.
- Synthetic corticosteroid: Medrysone is a synthetic corticosteroid; structurally related to progesterone.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined: Ocular: Acute anterior uveitis, allergic reactions, blurred vision (mild, temporary), burning, cataracts, conjunctivitis, corneal thinning, corneal ulcers, delayed wound healing, foreign body sensation, glaucoma, IOP increased, keratitis, mydriasis, optic nerve damage, ptosis, secondary ocular infection stinging, visual activity defects

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Monitoring ParametersIntraocular pressure (if duration of therapy is >10 days); periodic examination of lens (with prolonged use)

Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication is only for use in your eyes. Use exactly as directed. Wash hands thoroughly before using. Shake well before using. Do not allow applicator tip to touch eye. Gently pull down lower lid and put drop(s) into inner corner of eye. Close eye and roll eyeball in all directions. Do not blink for 30 seconds. Apply gentle pressure to inner corner of eye for 30 seconds. Gently wipe away any excess from skin around eye. Do not use any other eye medication for 10-15 minutes. May cause sensitivity to light (dark glasses may help); or temporary stinging, burning, or blurred vision. Report pain, swelling, scratchiness, itching, watering, or dryness of eye; drainage, redness, or sign of eye infection; change in vision (eg, double vision, reduced visual field, halo around lights); or worsening of condition or lack of improvement in 3-4 days. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Solution, ophthalmic: 1% (5 mL, 10 mL) [contains benzalkonium chloride] [DSC]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Suspension (HMS Liquifilm)

1% (5): $23.99

1% (10): $33.99

Mechanism of ActionDecreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability

Pharmacodynamics/Kinetics

Absorption: Through aqueous humor

Metabolism: Hepatic if absorbed

Excretion: Urine and feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsMedrysone is a synthetic corticosteroid structurally related to progesterone. If no improvement after several days of treatment, discontinue medrysone and institute other therapy. Duration of therapy is 3-4 days to several weeks, dependent on type and severity of disease.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Ponstel® may be confused with Pronestyl®

Pronunciation(me fe NAM ik AS id)

U.S. Brand NamesPonstel®

Canadian Brand NamesApo-Mefenamic®; Dom-Mefenamic Acid; Mefenamic-250; Nu-Mefenamic; PMS-Mefenamic Acid; Ponstan®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsShort-term relief of mild to moderate pain including primary dysmenorrhea

Dosing: AdultsMild-moderate pain: Oral: Initial: 500 mg; then 250 mg every 4 hours as needed; maximum therapy: 1 week

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >14 years: Refer to adult dosing.

Dosing: Renal ImpairmentNot recommended for use

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to mefenamic acid, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery; active ulceration or chronic inflammation of the GI tract; renal disease

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children <14 years of age.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers, omeprazole, and sucralfate is not effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects such as confusion, agitation, and hallucination are generally seen in overdose or high-dose situations, but elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

LactationEnters breast milk (trace amounts)/not recommended (AAP rates “compatible”)

Adverse Reactions

1% to 10%:

Central nervous system: Headache, nervousness, dizziness (3% to 9%)

Dermatologic: Itching, rash

Endocrine & metabolic: Fluid retention

Gastrointestinal: Abdominal cramps, heartburn, indigestion, nausea (1% to 10%), vomiting (1% to 10%), diarrhea (1% to 10%), constipation (1% to 10%), abdominal distress/cramping/pain (1% to 10%), dyspepsia (1% to 10%), flatulence (1% to 10%), gastric or duodenal ulcer with bleeding or perforation (1% to 10%), gastritis (1% to 10%)

Hematologic: Bleeding (1% to 10%)

Hepatic: Elevated LFTs (1% to 10%)

Otic: Tinnitus (1% to 10%)

<1%: CHF, hypertension, arrhythmia, tachycardia, confusion, hallucinations, aseptic meningitis, mental depression, drowsiness, insomnia, urticaria, erythema multiforme, toxic epidermal necrolysis, Stevens-Johnson syndrome, angioedema, polydipsia, hot flashes, gastritis, GI ulceration, cystitis, polyuria, agranulocytosis, anemia, hemolytic anemia, bone marrow suppression, leukopenia, thrombocytopenia, hepatitis, peripheral neuropathy, toxic amblyopia, blurred vision, conjunctivitis, dry eyes, decreased hearing, acute renal failure, dyspnea, allergic rhinitis, epistaxis, stomatitis

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor); **Inhibits** CYP2C9 (strong)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsIncreased chloride (S), increased sodium (S), positive Coombs' [direct], false-positive urinary bilirubin
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg

Ponstel®: 250 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Mefenamic Acid)

250 mg (100): $609.99

Capsules (Ponstel)

250 mg (100): $746.35

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Onset of action: Peak effect: 2-4 hours

Duration: ≤6 hours

Protein binding: High

Metabolism: Conjugated hepatically

Half-life elimination: 3.5 hours

Excretion: Urine (50%) and feces as unchanged drug and metabolites

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®). Recovery of platelet function usually occurs 1-2 days after discontinuation of NSAIDs.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness, may rarely cause confusion, hallucination, or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine or carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin’s inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Mefloquine

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(ME floe kwin)
U.S. Brand NamesLariam® [DSC]
Canadian Brand NamesApo-Mefloquine®; Lariam®
Pharmacologic CategoryAntimalarial Agent
Use: Labeled IndicationsTreatment of acute malarial infections and prevention of malaria
Dosing: AdultsDose expressed as mg of mefloquine hydrochloride:

Malaria treatment (mild to moderate infection): Oral: 5 tablets (1250 mg) as a single dose. If clinical improvement is not seen within 48-72 hours, an alternative therapy should be used for retreatment.

Malaria prophylaxis: Oral: 1 tablet (250 mg) weekly starting 1 week before arrival in endemic area, continuing weekly during travel and for 4 weeks after leaving endemic area

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricDose expressed as mg of mefloquine hydrochloride: Children ≥6 months and >5 kg:

Malaria treatment: Oral: 20-25 mg/kg in 2 divided doses, taken 6-8 hours apart (maximum: 1250 mg). If clinical improvement is not seen within 48-72 hours, an alternative therapy should be used for retreatment.

Malaria prophylaxis: Oral: 5 mg/kg/once weekly (maximum dose: 250 mg) starting 1 week before arrival in endemic area, continuing weekly during travel and for 4 weeks after leaving endemic area

Dosing: Renal ImpairmentNo dosage adjustment needed in patients with renal impairment or on dialysis.
Dosing: Hepatic ImpairmentHalf-life may be prolonged and plasma levels may be higher. Specific dosing adjustments are not available.
Administration: OralAdminister with food and with at least 8 oz of water. When used for malaria prophylaxis, dose should be taken once weekly on the same day each week. If vomiting occurs within 30 minutes after the dose , an additional full dose should be given; if it occurs within 30-60 minutes after dose, an additional half-dose should be given. Tablets may be crushed and suspended in a small amount of water, milk, or another beverage for persons unable to swallow tablets.
Dietary ConsiderationsTake with food and with at least 8 oz of water.
StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
RestrictionsAn FDA-approved medication guide and wallet card must be distributed when dispensing an outpatient prescription (new or refill) to prevent malaria where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.
ContraindicationsHypersensitivity to mefloquine, related compounds (eg, quinine and quinidine), or any component of the formulation; prophylactic use in patients with a history of seizures or severe psychiatric disorder (including active or recent history of depression, generalized anxiety disorder, psychosis, or schizophrenia)
Allergy Considerations

- QuiNIDine/QuiNINE Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Dizziness, loss of balance, and other CNS disorders (eg, seizures) have been reported; due to long half-life, effects may persist after mefloquine is discontinued. Use caution in activities requiring alertness and fine motor coordination (eg, driving, piloting planes, operating machinery).

- Psychiatric effects: May cause a range of psychiatric symptoms (anxiety, paranoia, depression, hallucinations and psychosis). Occasionally, symptoms have been reported to persist long after mefloquine has been discontinued. Suicidal ideation and suicide have been reported rarely (no causal relationship established). The appearance of psychiatric symptoms such as acute anxiety, depression, restlessness or confusion may be considered a prodrome to more serious events. Discontinue if unexplained neuropsychiatric disturbances occur. Use with caution in patients with a previous history of depression; prophylactic use is contraindicated in patients with active or recent history of psychiatric disorders.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with significant cardiac disease; ECG changes have been reported.

- Hepatic impairment: Use with caution in patients with hepatic impairment; elimination may be prolonged.

- *Plasmodium falciparum* infections: Appropriate use: In cases of life-threatening, serious, or overwhelming malaria infections due to *Plasmodium falciparum*, patients should be treated with intravenous antimalarial drug. Mefloquine may be given orally to complete the course.

- Seizure disorder: When using for treatment, use with caution in patients with a history of seizures; increase risk of seizures. Prophylactic use is conctraindicated in patients with seizure disorder.

Concurrent drug therapy issues:

- Chloroquine: Concurrent use with chloroquine may increase risk of seizures.
- Quinine derivatives: Concurrent use with quinidine and quinine may increase risk of ECG abnormalities and seizures.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <6 months of age. Early vomiting leading to treatment failure in children has been reported in some studies; consider alternate therapy if a second dose is not tolerated.

Other warnings/precautions:

- Prolonged use: If mefloquine is to be used for a prolonged period, liver function tests and ophthalmic examinations should be performed periodically. (Retinal abnormalities have not been observed with mefloquine in humans; however, it has with long-term administration to rats.)

Pregnancy Risk FactorC

Pregnancy ConsiderationsMefloquine crosses the placenta and is teratogenic in animals. There are no adequate and well-controlled studies in pregnant women, however, clinical experience has not shown teratogenic or embryotoxic effects; use with caution during pregnancy if travel to endemic areas cannot be postponed. Nonpregnant women of childbearing potential are advised to use contraception and avoid pregnancy during malaria prophylaxis and for 3 months thereafter. In case of an unplanned pregnancy, treatment with mefloquine is not considered a reason for pregnancy termination.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsExcreted in small quantities; effect to nursing infant is unknown. Breast-feeding is not recommended during therapy and the long half-life of mefloquine should also be considered once therapy is complete.

Adverse Reactions

1% to 10%:

Central nervous system: Chills, dizziness, fatigue, fever, headache

Dermatologic: Rash

Gastrointestinal: Vomiting (3%), abdominal pain, appetite decreased, diarrhea, nausea

Neuromuscular & skeletal: Myalgia

Otic: Tinnitus

<1%: Alopecia, bradycardia, emotional lability, extrasystoles, pruritus, seizure, syncope, weakness

Postmarketing and/or case reports: Abnormal dreams, ataxia, aggressive behavior, agitation, anxiety, arthralgia, AV block, bradycardia, cardiac arrest (with concomitant use of propranolol), chest pain, conduction abnormalities (transient), confusion, depression, diaphoresis increased, dyspepsia, dyspnea, edema, encephalopathy, erythema, erythema multiforme, exanthema, flushing, forgetfulness, hallucinations, hearing impairment, hematocrit decreased, hyper-/hypotension, insomnia, irregular pulse, leukocytosis, liver function tests increased, loss of balance, malaise, mood changes, muscle cramps/weakness, palpitation, panic attacks, paranoia, paresthesia, pneumonitis (allergic etiology), psychosis, restlessness, somnolence, Stevens-Johnson syndrome, suicidal ideation and behavior (causal relationship not established), tachycardia, thrombocytopenia, tremor, urticaria, vertigo, visual disturbances

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP2D6 (weak), 3A4 (weak)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Aminoquinolines (Antimalarial): May enhance the adverse/toxic effect of Mefloquine. Specifically, the risk for QTc-prolongation and the risk for convulsions may be increased. Mefloquine may increase the serum concentration of Aminoquinolines (Antimalarial). Management: Avoid concurrent use, and delay administration of mefloquine until at least 12 hours after the last dose of an aminoquinoline antimalarial when possible. *Risk X: Avoid combination*

Anticonvulsants: Mefloquine may diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antimalarial Agents may increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Halofantrine: Mefloquine may enhance the QTc-prolonging effect of Halofantrine. *Risk X: Avoid combination*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: May enhance the adverse/toxic effect of Mefloquine. Specifically, the risk for QTc-prolongation and the risk for convulsions may be increased. Management: Avoid concurrent use, and delay administration of mefloquine until at least 12 hours after the last dose of quinidine when possible. *Risk X: Avoid combination*

QuiNINE: May enhance the adverse/toxic effect of Mefloquine. Specifically, the risk for QTc-prolongation and the risk for convulsions may be increased. Mefloquine may increase the serum concentration of QuiNINE. Management: Avoid concurrent use, and delay administration of mefloquine until at least 12 hours after the last dose of quinine when possible. *Risk X: Avoid combination*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

Typhoid Vaccine: Mefloquine may enhance the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Food increases bioavailability by ~40%.

Herb/Nutraceutical: Mefloquine serum concentration may be decreased by St John's wort; avoid concurrent use.

Monitoring ParametersWhen use is prolonged, periodic liver function tests and ocular examinations

Nursing: Physical Assessment/MonitoringPrior to beginning therapy, assess potential for interactions with pharmacological or herbal products patient may be taking. Assess therapeutic effects and adverse reactions (eg, hypertension, cardiomyopathy, hyperglycemia, hepatotoxicity) on a regular basis throughout therapy. Monitor patient closely for any development of psychiatric symptoms (anxiety, paranoia, depression, hallucinations, and psychosis); may persist long after mefloquine has been discontinued. Advise patient about the importance of carrying medication guide and wallet provided when mefloquine is dispensed for malaria. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report..

Monitoring: Lab TestsWhen use is prolonged, periodically monitor liver function tests.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Follow exact dosage schedule and do not take more than prescribed. Take with food and at least 8 oz of water. Maintain adequate nutrition and maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake). Carry drug information card in wallet for as long as you are taking this drug. May cause dizziness, anxiety, loss of balance (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea, vomiting, or decreased appetite (small, frequent meals, frequent mouth care, or chewing gum may help). Report immediately any anxiety, confusion, agitation, restlessness, paranoia, depression, hallucinations, suicidal ideation. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to be pregnant or breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Tablet, as hydrochloride: 250 mg [equivalent to 228 mg base]

Lariam®: 250 mg [equivalent to 228 mg base] [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Lariam)

250 mg (25): $309.97

Mechanism of ActionMefloquine is a quinoline-methanol compound structurally similar to quinine; mefloquine's effectiveness in the treatment and prophylaxis of malaria is due to the destruction of the asexual blood forms of the malarial pathogens that affect humans, *Plasmodium falciparum*, *P. vivax*, *P. malariae*, *P. ovale*

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V_d: ~20 L/kg; blood, urine, CSF, tissues; enters breast milk

Protein binding: 98%

Metabolism: Extensively hepatic to 2,8-bis-trifluoromethyl-4-quinoline carboxylic acid (inactive) and other metabolites

Bioavailability: Increased by food

Half-life elimination: ~3 weeks (range: 2-4 weeks)

Time to peak, plasma: 6-24 hours (median: ~17 hours)

Excretion: Primarily bile and feces; urine (9% as unchanged drug, 4% as primary metabolite)

Related Information

- Immunization Recommendations
- Malaria Treatment

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, agitation, confusion, paranoia, depression, hallucinations, and psychotic behavior. Case reports of suicide and suicidal ideation have been reported.

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone. Concurrent use with valproic acid may alter valproate blood levels; monitor levels. Contraindicated in patients with active depression, recent history of depression, generalized anxiety disorder, psychosis, schizophrenia, or with a history of convulsions. In patients taking anticonvulsants (valproic acid, carbamazepine) the concomitant use of mefloquine may reduce seizure control by lowering plasma concentrations.

Index TermsMefloquine Hydrochloride

Megestrol

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Megace® may be confused with Reglan®

Pronunciation(me JES trole)

U.S. Brand NamesMegace®; Megace® ES

Canadian Brand NamesApo-Megestrol®; Megace®; Megace® OS; Nu-Megestrol

Pharmacologic CategoryAntineoplastic Agent, Hormone; Appetite Stimulant; Progestin

Use: Labeled IndicationsPalliative treatment of breast and endometrial carcinoma; treatment of anorexia, cachexia, or unexplained significant weight loss in patients with AIDS

Dosing: Adults**Note:** Megace® ES suspension is not equivalent to other formulations on a mg-per-mg basis.

Breast carcinoma (females): Refer to individual protocols: Oral: Tablet: 40 mg 4 times/day

Endometrial carcinoma: Refer to individual protocols: Oral: Tablet: 40-320 mg/day in divided doses; use for 2 months to determine efficacy; maximum doses used have been up to 800 mg/day.

HIV-related cachexia (males/females): Oral: Suspension:

Megace®: Initial dose: 800 mg/day; daily doses of 400 and 800 mg/day were found to be clinically effective

Megace® ES: 625 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo data available; however, the urinary excretion of megestrol acetate administered in doses of 4-90 mg ranged from 57% to 78% within 10 days.

Administration: OralMegestrol acetate (Megace®) oral suspension is compatible with water, orange juice, apple juice, or Sustacal H.C. for immediate consumption. Shake suspension well before use.

Storage

Suspension: Store at 15°C to 25°C (59°F to 77°F); protect from heat.

Tablet: Store at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F); protect from heat (temperatures >40°C [>104°F])

ContraindicationsHypersensitivity to megestrol or any component of the formulation; pregnancy (suspension)

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Adrenal suppression: May suppress hypothalamic-pituitary-adrenal (HPA) axis during chronic administration; consider the possibility of adrenal suppression in any patient receiving or being withdrawn from chronic therapy when signs/symptoms suggestive of hypoadrenalism are noted (during stress or in unstressed state). Laboratory evaluation and replacement/stress doses of rapid-acting glucocorticoid should be considered.

Disease-related concerns:

- Diabetes: New-onset diabetes mellitus and exacerbation of pre-existing diabetes have been reported with long-term use.

- Thromboembolism: Use with caution in patients with a history of thromboembolic disease.

Special populations:

- Females: Vaginal bleeding or discharge may occur.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Concentrated suspension: Megace® ES suspension in not equivalent to other formulations on a mg-per-mg basis; Megace® ES suspension 625 mg/5 mL is equivalent to megestrol acetate suspension 800 mg/20 mL.

Geriatric ConsiderationsElderly females may have vaginal bleeding or discharge and need to be forewarned of this side effect and inconvenience. No specific changes in dose are required for the elderly. Megestrol has been used in the treatment of the failure to thrive syndrome in cachectic elderly in addition to proper nutrition. Data does not support the use of megestrol for weight gain. The increase in weight tends to be mostly fat instead of lean body mass. Also, this agent is associated with DVTs.

Pregnancy Risk FactorD (tablet) / X (suspension)

Pregnancy ConsiderationsAdverse effects were demonstrated in animal studies. Use during pregnancy is contraindicated (suspension).

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsDue to the potential for adverse reaction in the newborn, the manufacturer recommends discontinuing breast feeding while receiving megestrol. In addition, HIV-infected mothers are discouraged from breast-feeding to decrease the potential transmission of HIV.

Adverse Reactions

Frequency not always defined.

Cardiovascular: Hypertension (≤8%), cardiomyopathy (1% to 3%), chest pain (1% to 3%), edema (1% to 3%), palpitation (1% to 3%), peripheral edema (1% to 3%), heart failure

Central nervous system: Headache (≤10%), insomnia (≤6%), fever (1% to 6%), pain (≤6%, similar to placebo), abnormal thinking (1% to 3%), confusion (1% to 3%), depression (1% to 3%), hypoesthesia (1% to 3%), seizure (1% to 3%), mood changes, malaise, lethargy

Dermatologic: Rash (2% to 12%), alopecia (1% to 3%), pruritus (1% to 3%), vesiculobullous rash (1% to 3%)

Endocrine & metabolic: Hyperglycemia (≤6%), gynecomastia (1% to 3%), adrenal insufficiency, amenorrhea, breakthrough bleeding, cervical erosion and secretions (changes), breast tenderness increased, Cushing's syndrome, diabetes, glucose intolerance, HPA axis suppression, hot flashes, hypercalcemia, menstrual flow changes, spotting, vaginal bleeding pattern changes

Gastrointestinal: Diarrhea (6% to 15%, similar to placebo), flatulence (≤10%), vomiting (≤6%), nausea (≤5%), dyspepsia (≤4%), abdominal pain (1% to 3%), constipation (1% to 3%), salivation increased (1% to 3%), xerostomia (1% to 3%), weight gain (not attributed to edema or fluid retention)

Genitourinary: Impotence (4% to 14%), decreased libido (≤5%), urinary incontinence (1% to 3%), urinary tract infection (1% to 3%), urinary frequency (≤2%)

Hematologic: Anemia (≤5%), leukopenia (1% to 3%)

Hepatic: Hepatomegaly (1% to 3%), LDH increased (1% to 3%), cholestatic jaundice, hepatotoxicity

Neuromuscular & skeletal: Weakness (2% to 6%), neuropathy (1% to 3%), paresthesia (1% to 3%), carpal tunnel syndrome

Ocular: Amblyopia (1% to 3%)

Renal: Albuminuria (1% to 3%)

Respiratory: Dyspnea (1% to 3%), cough (1% to 3%), pharyngitis (1% to 3%), pneumonia (≤2%), hyperpnea

Miscellaneous: Diaphoresis (1% to 3%), herpes infection (1% to 3%), infection (1% to 3%), moniliasis (1% to 3%), tumor flare

Postmarketing and/or case reports: Thromboembolic phenomena (including deep vein thrombosis, pulmonary embolism, thrombophlebitis)

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid herbs with progestogenic properties (eg, bloodroot, chasteberry, damiana, oregano, and yucca); may enhance the adverse/toxic effect of megestrol.

Test InteractionsAltered thyroid and liver function tests

Monitoring ParametersObserve for signs of thromboembolic phenomena; blood pressure, weight; serum glucose

Nursing: Physical Assessment/MonitoringPrior to beginning therapy, assess potential for interactions with herbal products patient may be taking. Assess therapeutic effects (according to purpose for use) and adverse reactions (eg, hypertension, CNS changes [confusion, convulsions, insomnia], rash, changes in menses, gastrointestinal upset, jaundice, thrombophlebitis) regularly during therapy. Teach patient proper use, possible side effects/appropriate interventions (eg, importance of adequate hydration, importance of avoiding pregnancy), and adverse symptoms to report.

Monitoring: Lab TestsSerum glucose

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Follow dosage schedule and do not take more than prescribed. May cause sensitivity to sunlight (use sunblock, wear protective clothing, and avoid extended exposure to direct sunlight); dizziness, anxiety, depression (use caution when driving or engaging in tasks that require alertness until response to drug is known); change in appetite (maintain adequate hydration [2-3 L/day of fluids, unless instructed to restrict fluid intake] and diet); decreased libido or increased body hair (reversible when drug is discontinued); or hot flashes (cool clothes and environment may help). Report swelling of face, lips, or mouth; absent or altered menses; abdominal pain; vaginal itching, irritation, or discharge; heat, warmth, redness, or swelling of extremities; or sudden onset change in vision. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication and for 1 month following therapy; consult prescriber for appropriate contraceptives. This drug may cause fetal defects. Do not donate blood during or for 1 month following therapy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral, as acetate: 40 mg/mL (10 mL, 20 mL, 240 mL, 480 mL)

Megace®: 40 mg/mL (240 mL) [contains ethanol 0.06% and sodium benzoate; lemon-lime flavor]

Megace® ES: 125 mg/mL (150 mL) [contains ethanol 0.06% and sodium benzoate; lemon-lime flavor]

Tablet, as acetate: 20 mg, 40 mg

Generic AvailableYes: Excludes Megace® ES

Pricing: U.S. (www.drugstore.com)

Suspension (Megace ES)

625 mg/5 mL (150): $590.12

Suspension (Megace Oral)

40 mg/mL (240): $167.52

Suspension (Megestrol Acetate)

40 mg/mL (240): $131.33

Tablets (Megestrol Acetate)

20 mg (100): $37.99

40 mg (100): $52.99

Mechanism of ActionA synthetic progestin with antiestrogenic properties which disrupt the estrogen receptor cycle. Megestrol interferes with the normal estrogen cycle and results in a lower LH titer. May also have a direct effect on the endometrium. Megestrol is an antineoplastic progestin thought to act through an antileutenizing effect mediated via the pituitary. May stimulate appetite by antagonizing the metabolic effects of catabolic cytokines.

Pharmacodynamics/Kinetics

Absorption: Well absorbed orally

Metabolism: Hepatic (to free steroids and glucuronide conjugates)

Half-life elimination: 13-105 hours

Time to peak, serum: 1-3 hours

Excretion: Urine (57% to 78%; 5% to 8% as metabolites); feces (8% to 30%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause myelosuppression; use caution with clozapine and carbamazepine

Index Terms5071-1DL(6); Megestrol Acetate; NSC-71423

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(mel OKS i kam)

U.S. Brand NamesMobic®

Canadian Brand NamesApo-Meloxicam®; CO Meloxicam; Gen-Meloxicam; Mobicox®; Mobic®; Novo-Meloxicam; PMS-Meloxicam

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsRelief of signs and symptoms of osteoarthritis, rheumatoid arthritis, and juvenile rheumatoid arthritis (JRA)

Dosing: AdultsOsteoarthritis, rheumatoid arthritis: Oral: Initial: 7.5 mg once daily; some patients may receive additional benefit from increasing dose to 15 mg once daily; maximum dose: 15 mg/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricJRA: Oral: Children ≥2 years: 0.125 mg/kg/day; maximum dose: 7.5 mg/day

Dosing: Renal Impairment

Mild to moderate impairment: No specific dosage recommendations

Significant impairment (Cl_{cr} ≤15 mL/minute): Patients with severe renal impairment have not been adequately studied; use not recommended.

Hemodialysis: Supplemental dose after dialysis not necessary.

Dosing: Hepatic Impairment

Mild (Child-Pugh class A) to moderate (Child-Pugh class B) hepatic dysfunction: No dosage adjustment is necessary

Severe hepatic impairment: Patients with severe hepatic impairment have not been adequately studied

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Dietary ConsiderationsShould be taken with food or milk to minimize gastrointestinal irritation.

StorageStore at 25°C (77°F). Protect tablets from moisture.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity (eg, asthma, urticaria, allergic-type reactions) to meloxicam, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.
- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs even at low doses.

- Pediatrics: Safety and efficacy have not been established in children <2 years of age.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsMen ≥65 years of age exhibited steady-state plasma concentrations and pharmacokinetics similar to younger men. Elderly women (≥65 years of age) had nearly a 50% greater AUC and 32% higher C_{max} compared to younger women.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsMay cause premature closure of the ductus arteriosus in the 3rd trimester of pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known whether meloxicam is excreted in human milk. Due to a potential for serious adverse reactions, the manufacturer recommends that a decision be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse ReactionsPercentages reported in adult patients; abdominal pain, diarrhea, fever, headache, pyrexia, and vomiting were reported more commonly in pediatric patients

2% to 10%:

Cardiovascular: Edema (≤5%)

Central nervous system: Headache (2% to 8%), pain (1% to 5%), dizziness (≤4%), insomnia (≤4%)

Dermatologic: Pruritus (≤2%), rash (≤3%)

Gastrointestinal: Dyspepsia (4% to 10%), diarrhea (2% to 8%), nausea (2% to 7%), abdominal pain (2% to 5%), constipation (≤3%), flatulence (≤3%), vomiting (≤3%)

Genitourinary: Urinary tract infection (≤7%), micturition (≤2%)

Hematologic: Anemia (≤4%)

Neuromuscular & skeletal: Arthralgia (≤5%), back pain (≤3%)

Respiratory: Upper respiratory infection (≤8%), cough (≤2%), pharyngitis (≤3%)

Miscellaneous: Flu-like syndrome (2% to 6%), falls (≤3%)

<2%: Abnormal dreams, abnormal vision, albuminuria, allergic reaction, alopecia, angina, angioedema, anxiety, appetite increased, arrhythmia, asthma, bilirubinemia, bronchospasm, bullous eruption, BUN increased, cardiac failure, colitis, confusion, conjunctivitis, creatinine increased, dehydration, depression, diaphoresis, duodenal perforation, duodenal ulcer, dyspnea, edema (facial), eructation, esophagitis, fatigue, fever, gastric perforation, gastric ulcer, gastritis, gastroesophageal reflux, gastrointestinal hemorrhage, GGT increased, hematemesis, hematuria, hepatitis, hot flushes, hyper-/hypotension, intestinal perforation, leukopenia, malaise, melena, MI, nervousness, palpitation, pancreatitis, paresthesia, photosensitivity reaction, pruritus, purpura, renal failure, seizure, somnolence, syncope, tachycardia, taste perversion, thrombocytopenia, tinnitus, transaminases increased, tremor, ulcerative stomatitis, urticaria, vasculitis, vertigo, xerostomia, weight gain/loss

Postmarketing and/or case reports: Agranulocytosis, anaphylactoid reactions, erythema multiforme, exfoliative dermatitis, hepatic failure, interstitial nephritis, jaundice, mood alterations, shock, Stevens-Johnson syndrome, toxic epidermal necrolysis, urinary retention (acute)

Metabolism/Transport Effects **Substrate** (minor) of CYP2C9, 3A4; **Inhibits** CYP2C9 (weak)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersPeriodic CBC, serum chemistries, liver function, renal function (serum BUN, and creatinine) with long-term use; signs and symptoms of bleeding

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsPeriodic CBC, serum chemistries, liver function, renal function (serum BUN, and creatinine) with long-term use

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid alcohol, excessive vitamin C intake, or salicylate-containing foods (eg, curry powder, prunes, raisins, tea, or licorice). Do not use aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); drowsiness, dizziness, nervousness, or headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known); or fluid retention (weigh yourself weekly and report unusual [3-5 lb/week] weight gain). GI bleeding, ulceration, or perforation can occur with or without pain; discontinue medication and contact prescriber if persistent abdominal pain or cramping, or blood in stool occurs. Report breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; slurring of speech; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; swollen extremities; skin blisters, rash, or itching; acute fatigue, jaundice, flu-like symptoms, hearing changes (ringing in ears); or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension: 7.5 mg/5 mL (100 mL)

Mobic®: 7.5 mg/5 mL (100 mL) [contains sodium benzoate; raspberry flavor]

Tablet: 7.5 mg, 15 mg

Mobic®: 7.5 mg, 15 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Suspension (Meloxicam)

7.5 mg/5 mL (100): $82.39

Tablets (Meloxicam)

7.5 mg (30): $16.36

Tablets (Mobic)

7.5 mg (30): $123.40

15 mg (30): $183.89

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Distribution: 10 L

Protein binding: ~99%, primarily to albumin

Metabolism: Hepatic via CYP2C9 and CYP3A4 (minor); forms 4 metabolites (inactive)

Bioavailability: 89%

Half-life elimination: Adults: 15-20 hours

Time to peak: Initial: 4-5 hours; Secondary: 12-14 hours

Excretion: Urine and feces (as inactive metabolites)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion, ulcerative stomatitis, and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; may rarely cause abnormal dreams, anxiety, confusion, depression, nervousness, and somnolence

Mental Health: Effects on Psychiatric TreatmentRare reports of agranulocytosis, use caution with clozapine and carbamazepine; lithium levels can be increased; avoid concurrent use if possible or monitor lithium levels and adjust dose. When NSAID is stopped, lithium will need adjustment again.

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin’s inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other Considerations

The 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Pharmacologic CategoryChemotherapy Regimen, Multiple Myeloma

Regimen UseMultiple myeloma

Regimen

Melphalan: Oral: 4 mg/m^2/day days 1 to 7

[total dose/cycle = 28 mg/m^2]

Prednisone: Oral: 40 mg/m^2/day days 1 to 7

[total dose/cycle = 280 mg/m^2]

Thalidomide: Oral: 100 mg/day days 1 to 28

[total dose/cycle = 2800 mg]

Repeat cycle every 28 days for 6 cycles

followed by

Thalidomide: Oral: 100 mg daily (as maintenance)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Melphalan may be confused with Mephyton®, Myleran®

Alkeran® may be confused with Alferon®, Leukeran®, Myleran®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(MEL fa lan)

U.S. Brand NamesAlkeran®

Canadian Brand NamesAlkeran®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent

Use: Labeled IndicationsPalliative treatment of multiple myeloma and nonresectable epithelial ovarian carcinoma

Use: Unlabeled/InvestigationalTreatment of neuroblastoma, rhabdomyosarcoma, breast cancer; part of an induction regimen for marrow and stem cell transplantation

Dosing: AdultsRefer to individual protocols; oral dose should always be adjusted to patient response and weekly blood counts.

Multiple myeloma:

Oral: Multiple regimens have been employed: **Note:** Response is gradual; may require repeated courses to realize benefit:

6 mg daily for 2-3 weeks initially, followed by up to 4 weeks rest, then a maintenance dose of 2 mg daily as hematologic recovery begins **or**

10 mg daily for 7-10 days; institute 2 mg daily maintenance dose after WBC >4000 cells/mm^3 and platelets >100,000 cells/mm^3 (~4-8 weeks); titrate maintenance dose to hematologic response **or**

0.15 mg/kg/day for 7 days, with a 2-6 week rest, followed by a maintenance dose of ≤0.05 mg/kg/day as hematologic recovery begins **or**

0.25 mg/kg/day for 4 days (or 0.2 mg/kg/day for 5 days); repeat at 4- to 6-week intervals as ANC and platelet counts return to normal

I.V.: 16 mg/m^2 administered at 2-week intervals for 4 doses, then administer at 4-week intervals after adequate hematologic recovery.

Ovarian carcinoma: Oral: 0.2 mg/kg/day for 5 days, repeat every 4-5 weeks

High dose BMT: I.V.: 140-240 mg/m^2 as a single dose or divided into 2-5 daily doses. Infuse over 20-60 minutes.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to individual protocols; oral dose should always be adjusted to patient response and weekly blood counts.

Various protocols (unlabeled use): Oral: 4-20 mg/m^2/day for 1-21 days

Pediatric rhabdomyosarcoma (unlabeled use): I.V.: 10-35 mg/m^2/dose every 21-28 days

High-dose melphalan with bone marrow transplantation for neuroblastoma (unlabeled use): I.V.: 70-100 mg/m^2/day on day 7 and 6 before BMT **or**

140-220 mg/m^2 single dose before BMT **or**

50 mg/m^2/day for 4 days **or**

70 mg/m^2/day for 3 days

Dosing: Renal Impairment

The FDA-approved labeling contains the following adjustment recommendations based on route of administration:

Oral: Moderate-to-severe renal impairment: Consider a reduced dose initially

I.V.: BUN >30 mg/dL: Reduce dose by up to 50%

The following guidelines have been used by some clinicians:

Aronoff, 2007 (route of administration not specified): Adults:

  - Cl_{cr} 10-50 mL/minute: Administer 75% of dose
  - Cl_{cr} <10 mL/minute: Administer 50% of dose
  - Hemodialysis: Administer dose after hemodialysis
  - Continuous ambulatory peritoneal dialysis (CAPD): Administer 50% of dose
  - Continuous renal replacement therapy (CRRT): Administer 75% of dose

Kintzel, 1995:

  - Oral: Adjust dose in the presence of hematologic toxicity
  - I.V.:
    - Cl_{cr} 46-60 mL/minute: Administer 85% of normal dose
    - Cl_{cr} 31-45 mL/minute: Administer 75% of normal dose
    - Cl_{cr} <30 mL/minute: Administer 70% of normal dose

Dosing: Hepatic Impairment   Melphalan is hepatically metabolized; however, dosage adjustment does not appear to be necessary (King, 2001).

Dosing: Combination Regimens

Gestational trophoblastic tumor:

  - CHAMOCA (Modified Bagshawe Regimen)
  - CHAMOMA (Bagshawe Regimen)

Lymphoma, Hodgkin's disease:

  - CAD/MOPP/ABV
  - mini-BEAM

Multiple myeloma:

  - Bortezomib-Melphalan-Prednisone
  - Bortezomib-Melphalan-Prednisone-Thalidomide
  - M-2
  - Melphalan-Prednisone-Thalidomide
  - MP (Multiple Myeloma)
  - VBMCP

Oncology: Bone Marrow - High DoseI.V.: 100-240 mg/m^2 administered as a single dose or divided into 2-4 daily doses. Maximum dose as a single agent: 200-400 mg/m^2. Maximum dose with total body irradiation (TBI): 110-140 mg/m^2; other high-dose chemotherapeutic drugs: 100-180 mg/m^2. Generally infused over 20-60 minutes.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Due to limited stability, complete administration of I.V. dose should occur within 60 minutes of reconstitution

  - I.V. infusion: Infuse over 15-20 minutes
  - I.V. bolus:
    - Central line: I.V. bolus doses of 17-200 mg/m^2 (reconstituted and not diluted) have been infused over 2-20 minutes
    - Peripheral line: I.V. bolus doses of 2-23 mg/m^2 (reconstituted and not diluted) have been infused over 1-4 minutes

Administration: I.V. DetailAvoid skin contact with I.V. formulation.

BMT only: Saline-based hydration (100-125 mg/m^2/hour) preceding (2-4 hours), during, and following (6-12 hours) administration reduces risk of drug precipitation in renal tubules. Hydrolysis causes loss of 1% melphalan injection per 10 minutes. Infusion of admixture must be completed within 100 minutes of preparation to deliver ordered dose. Reconstitute dose to 5 mg/mL in diluent provided by manufacturer. Dose may be infused via central or peripheral venous access without further dilution to minimize volume of infusion.

pH: 6.5-7.0

Administration: OralAdminister on an empty stomach.

Dietary ConsiderationsShould be taken on an empty stomach (1 hour prior to or 2 hours after meals).

Storage

Tablet: Store in refrigerator at 2°C to 8°C (36°F to 46°F). Protect from light.

Injection: Store at room temperature (15°C to 30°C). Protect from light. Reconstituted solution is chemically and physically stable for at least 90 minutes when stored at 25°C (77°F). Diluted solution is physically and chemically stable for at least 60 minutes at 25°C (77°F).

ReconstitutionInjection must be prepared fresh. **The time between reconstitution/dilution and administration of parenteral melphalan must be kept to a minimum (manufacturer recommends <60 minutes) because reconstituted and diluted solutions are unstable.** Dissolve powder initially with 10 mL of diluent to a concentration of 5 mg/mL. Shake vigorously to dissolve. **Immediately** dilute dose in 250-500 mL NS to a concentration of 0.1-0.45 mg/mL.

Compatibility**Incompatible** with D_5W, LR; **variable stability (consult detailed reference)** in NS.

Y-site administration: Compatible: Acyclovir, amikacin, aminophylline, ampicillin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisplatin, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, lorazepam, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metronidazole, minocycline, mitomycin, mitoxantrone, morphine, nalbuphine, netilmicin, ondansetron, pentostatin, piperacillin, plicamycin, potassium chloride, prochlorperazine edisylate, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Amphotericin B, chlorpromazine.

ContraindicationsHypersensitivity to melphalan or any component of the formulation; severe bone marrow suppression; patients whose disease was resistant to prior melphalan therapy; pregnancy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hypersensitivity reactions: See “Concerns related to adverse effects” below.
- Secondary malignancies: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Bone marrow suppression is common;** use with caution in patients with prior bone marrow suppression, impaired renal function (consider dose reduction), or who have received prior chemotherapy or irradiation.
- Fertility effects: Suppresses ovarian function and produces amenorrhea; may also cause testicular suppression.
- Hypersensitivity reactions: **[U.S. Boxed Warning]: Hypersensitivity has been reported with I.V. administration** and oral melphalan; may occur after multiple treatment cycles.
- Secondary malignancies: **[U.S. Boxed Warning]: Is potentially mutagenic, leukemogenic, and carcinogenic.**

Disease-related concerns:

- Infection: Signs of infection, such as fever and WBC rise, may not occur; lethargy and confusion may be more prominent signs of infection.

Special populations:

- Elderly: Toxicity to immunosuppressives is increased in elderly; start with lowest recommended adult doses.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Geriatric ConsiderationsToxicity to immunosuppressives is increased in the elderly. Start with lowest recommended adult doses. Signs of infection, such as fever and WBC rise, may not occur. Lethargy and confusion may be more prominent signs of infection.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated embryotoxicity and teratogenicity. Therapy may suppress ovarian function leading to amenorrhea. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy while on melphalan therapy.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Gastrointestinal: Vomiting (oral low-dose: <10%; I.V.: 30% to 90%)

Hematologic: Myelosuppression, leukopenia (onset 7 days; nadir 14-35 days; recovery 28-56 days), thrombocytopenia (onset 7 days; nadir 14-35 days; recovery 28-56 days)

Miscellaneous: Secondary malignancy (<2% to 20%; cumulative dose and duration dependent)

1% to 10%: Miscellaneous: Hypersensitivity (I.V.: 2%)

Infrequent, frequency undefined, postmarketing, and/or case reports: Agranulocytosis, allergic reactions, alopecia, amenorrhea, anaphylaxis, anemia, bladder irritation, bone marrow failure (irreversible), diarrhea, hemolytic anemia, hemorrhagic cystitis, hemorrhagic necrotic enterocolitis, hepatic veno-occlusive disease (I.V. melphalan), hepatitis, interstitial pneumonitis, jaundice, nausea, ovarian suppression, pruritus, pulmonary fibrosis, radiation myelopathy, rash, secondary carcinoma, secondary leukemia, secondary myeloproliferative syndrome, SIADH, skin hypersensitivity, skin necrosis, skin ulceration (injection site), skin vesiculation, sterility, stomatitis, testicular suppression, transaminases increased, vasculitis

Oncology: VesicantNo

Oncology: Emetic Potential

Oral: Very low (<10%)

I.V. (>50 mg/m^2): High (60% to 90%)

Oncology: Bone Marrow - Unique Toxicity

Cardiovascular: Atrial fibrillation, left ventricular heart failure

Dermatologic: Alopecia

Gastrointestinal: Mucositis (severity increases with Cl_{cr} ≤40 mL/minute; pretreatment with amifostine or glutamine may decrease mucositis), nausea and vomiting (moderate), diarrhea

Hematologic: Myelosuppression, secondary leukemia

Renal: Increased serum creatinine and azotemia possible without adequate hydration

Rare side effects: Abnormal LFTs, atrial fibrillation, interstitial pneumonitis, secondary leukemia, SIADH, vasculitis

Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

CycloSPORINE: Melphalan may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Nalidixic Acid: May enhance the adverse/toxic effect of Melphalan. Necrotic enterocolitis has been reported in pediatric patients. *Risk X: Avoid combination*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (due to GI irritation).

Food: Food interferes with oral absorption.

Test InteractionsFalse-positive Coombs' test [direct]

Monitoring ParametersCBC with differential and platelet count, serum electrolytes, serum uric acid

Nursing: Physical Assessment/MonitoringEvaluate patient for use cautions prior to beginning treatment. Assess potential for interactions with other pharmacological agents patient may be taking. For intravenous infusion, see Administration and Reconstitution specifics. Assess results of laboratory tests (especially hematologic parameters), patient response, and adverse reactions (eg, gastrointestinal upset, myelosuppression [leukopenia], diarrhea, hypersensitivity reaction) regularly during therapy. Teach patient proper use (oral), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count, serum electrolytes, serum uric acid

Patient Education**I.V.:** Report immediately any burning, swelling, pain, or redness at infusion or injection site. **Oral:** Preferable to take oral doses on an empty stomach, 1 hour before or 2 hours after meals. Avoid excessive alcohol (may increase gastric irritation). Maintain adequate nutrition (small, frequent meals may help) and adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). May cause nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); hair loss (reversible); easy bleeding or bruising (use soft toothbrush or cotton swabs and frequent mouth care, use electric razor, avoid sharp knives or scissors). Report persistent or severe nausea or vomiting; diarrhea or abdominal pain; chest pain or palpitations; difficulty or pain on urination; unusual bruising/bleeding; respiratory difficulty; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 50 mg [diluent contains ethanol and propylene glycol]

Tablet: 2 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablets (Alkeran)

2 mg (50): $239.99

Mechanism of ActionAlkylating agent which is a derivative of mechlorethamine that inhibits DNA and RNA synthesis via formation of carbonium ions; cross-links strands of DNA; acts on both resting and rapidly dividing tumor cells.

Pharmacodynamics/Kinetics

Absorption: Oral: Variable and incomplete

Distribution: V_d: 0.5-0.6 L/kg throughout total body water

Protein binding: 60% to 90%; primarily to albumin, 20% to α_1-acid glycoprotein
